Why should you care about the next collider - now?

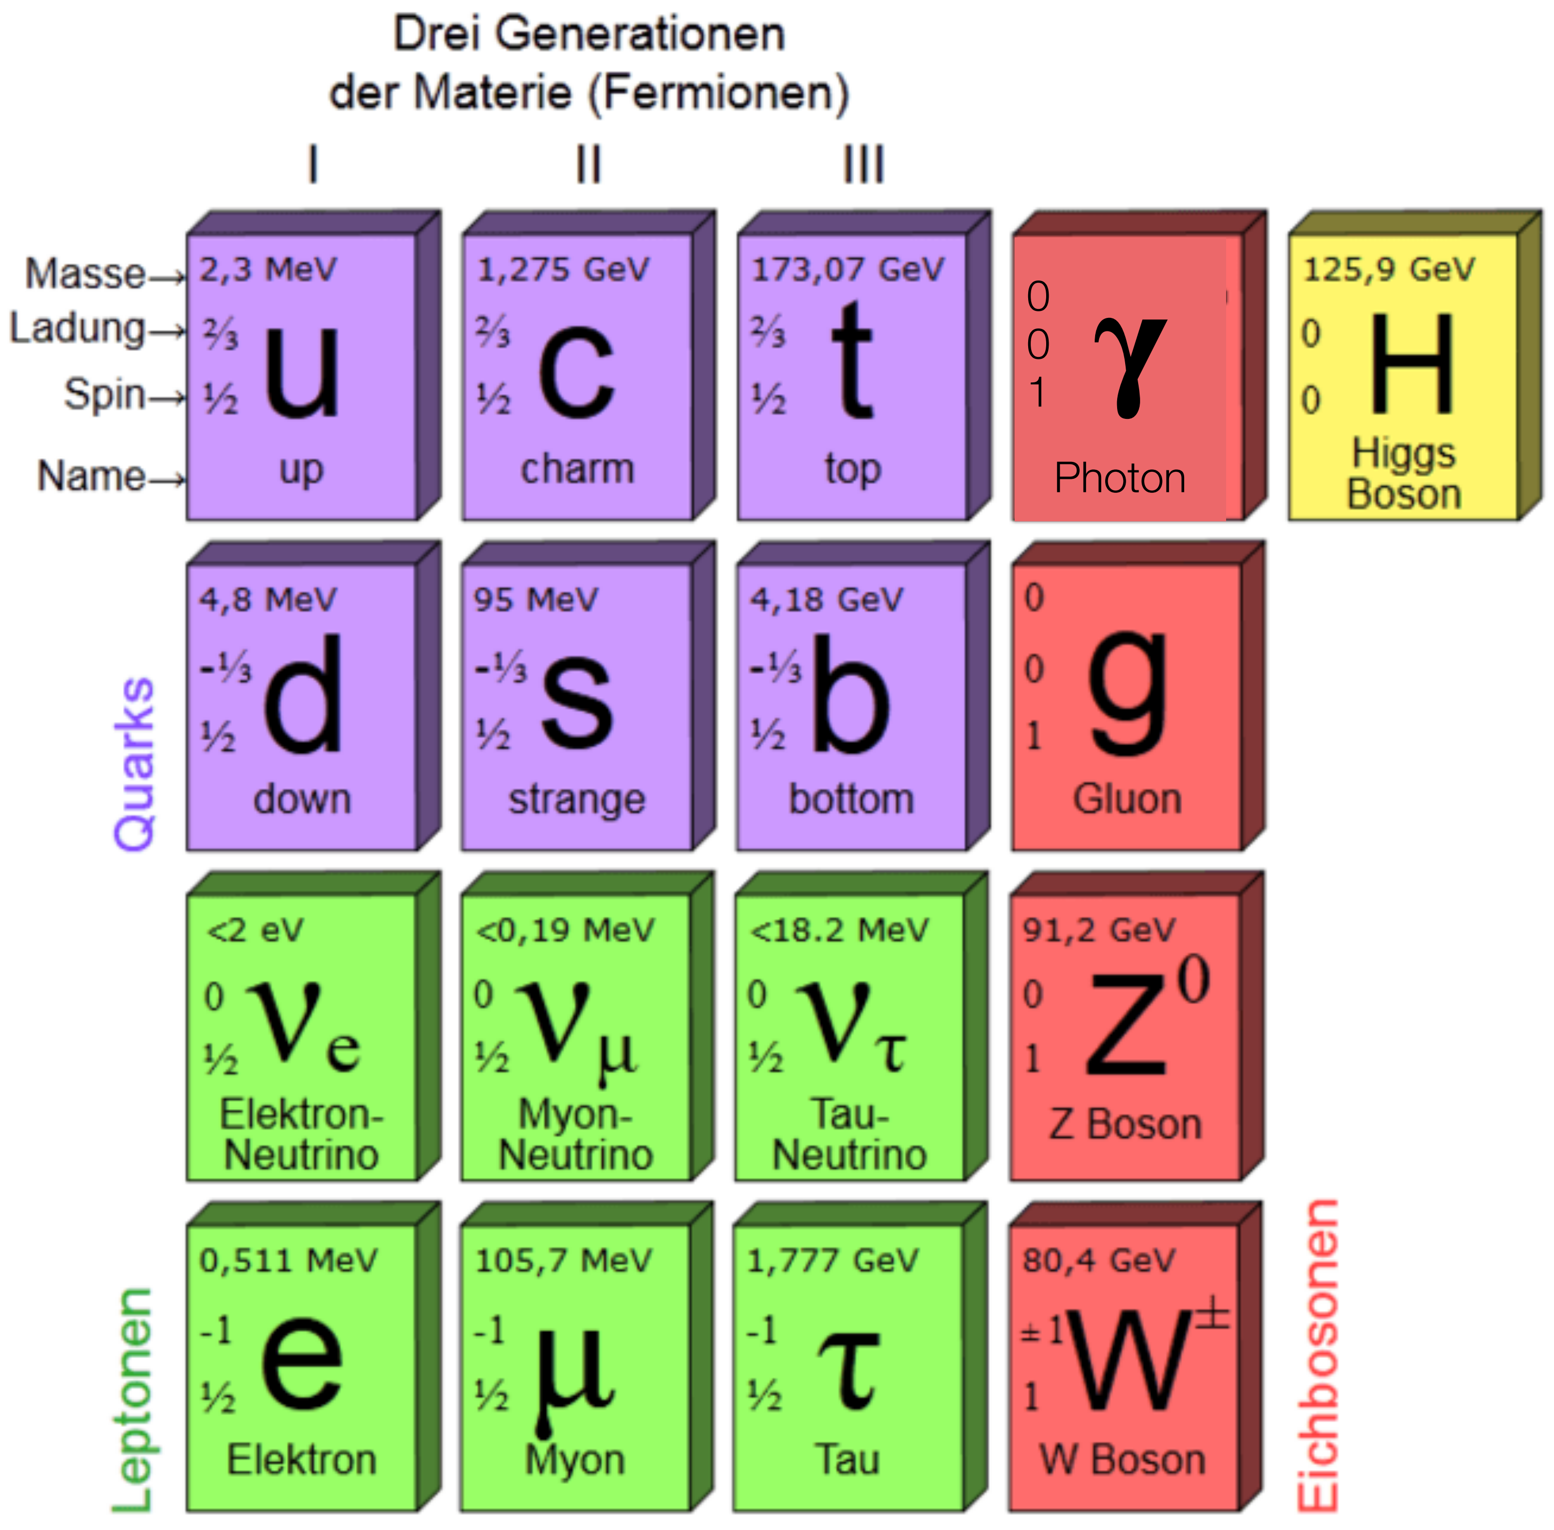
J. List (DESY/CERN)

Particle Physics Seminar, UTokyo, March 31, 2023

Introduction: Higgs Physics & Higgs Factories

The Higgs Boson and the Standard Model of Particle Physics

A discovery which is only the beginning …

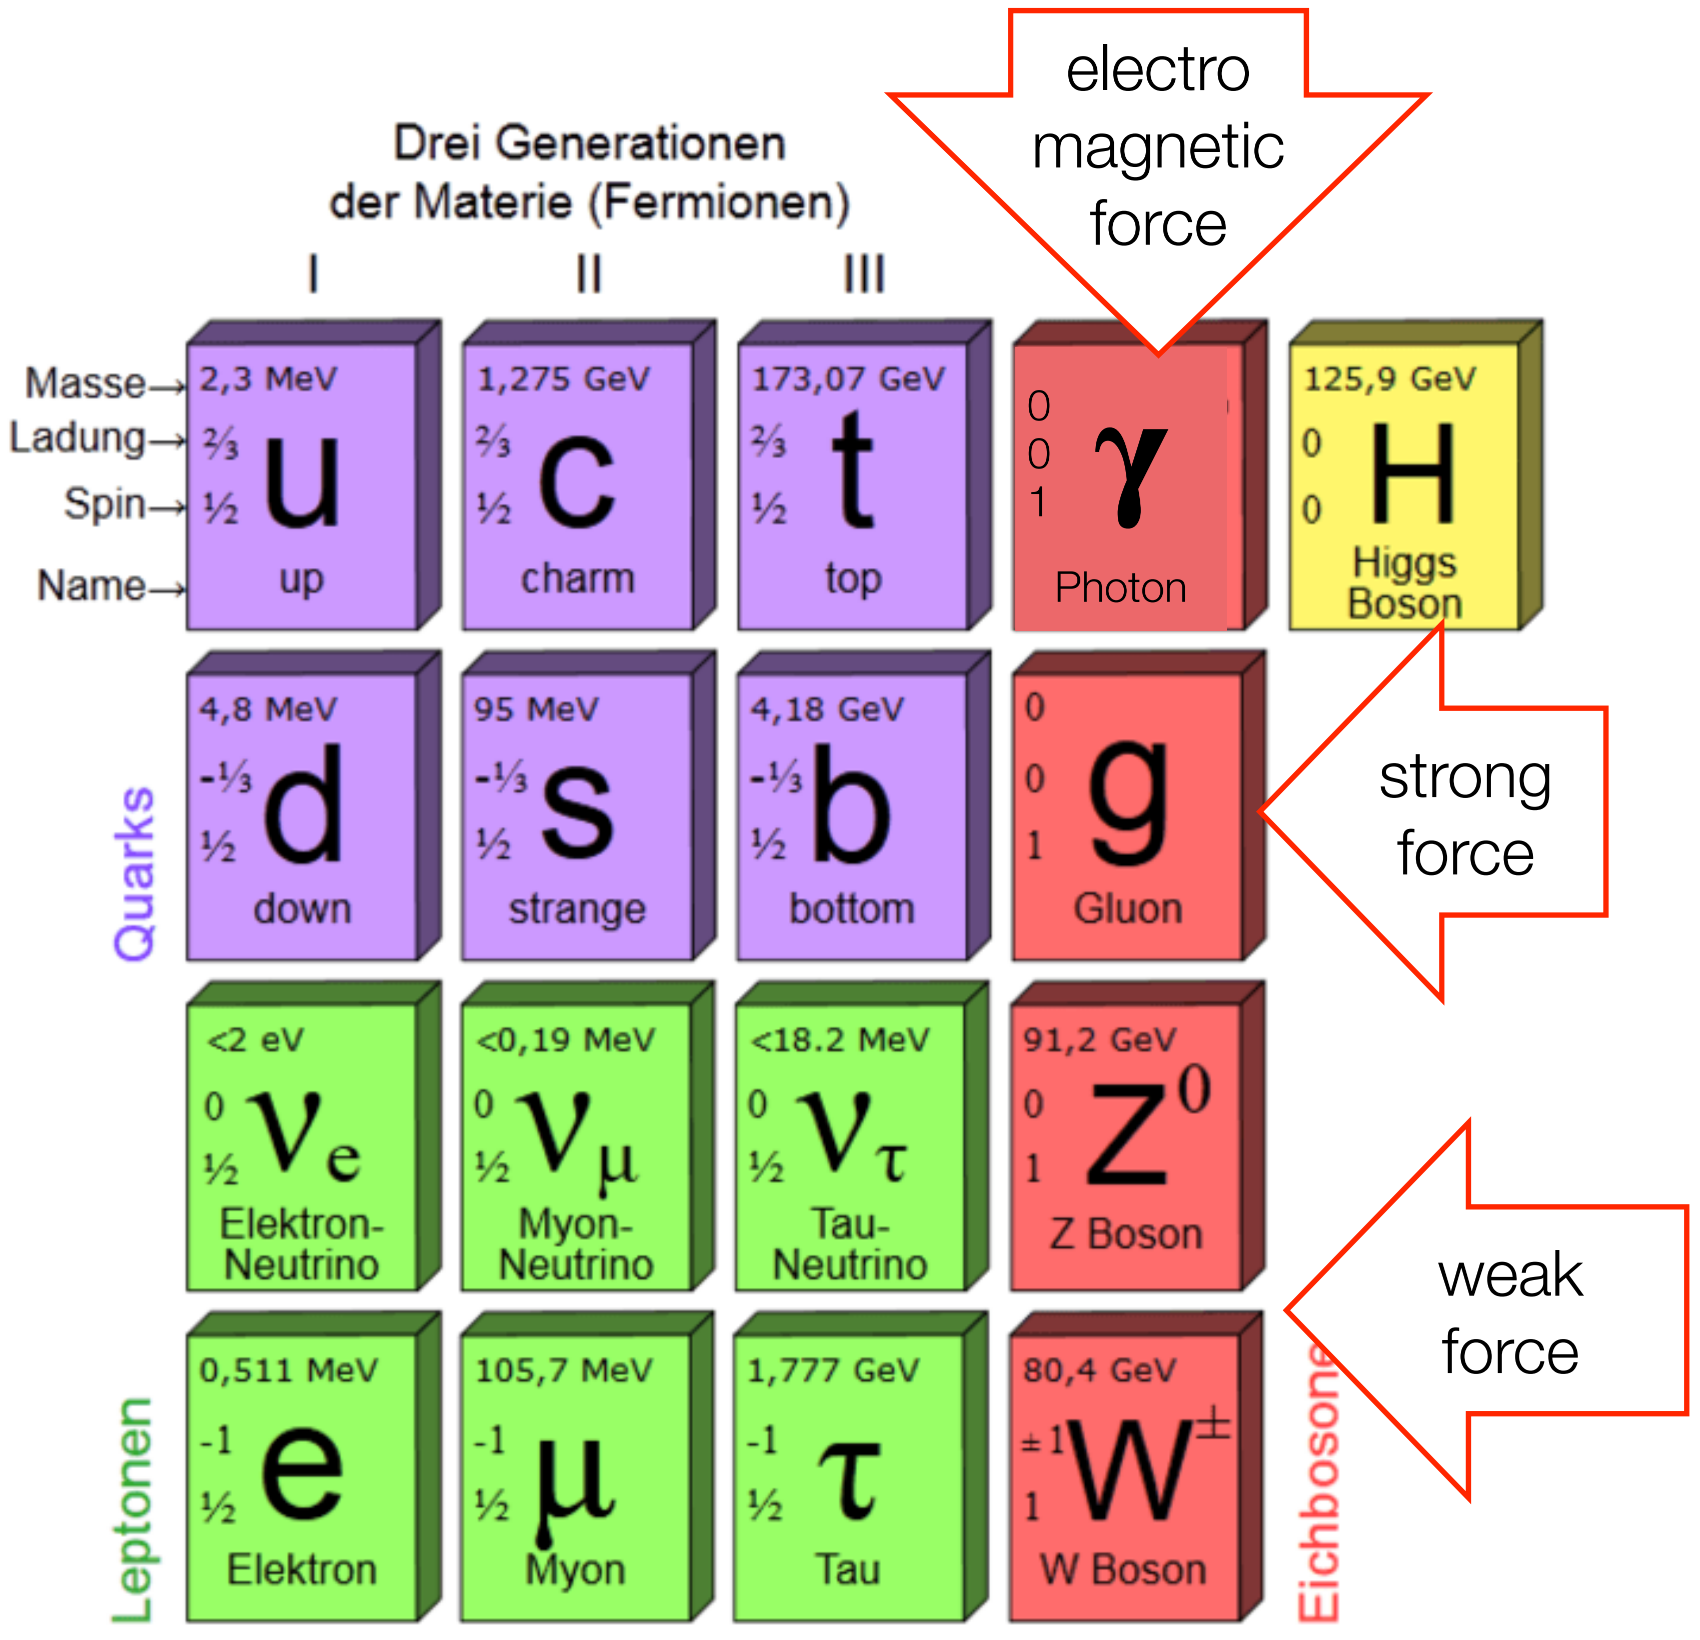


The Standard Model of Particle Physics

- describes (nearly) all measurements down to the level of quantum fluctuations
- based on only a few fundamental ideas:
  - special relativity
  - quantum mechanics
  - invariance under local gauge transformations: $SU(3)xSU(2)_LxU(1)_Y$

The Higgs Boson and the Standard Model of Particle Physics

A discovery which is only the beginning …

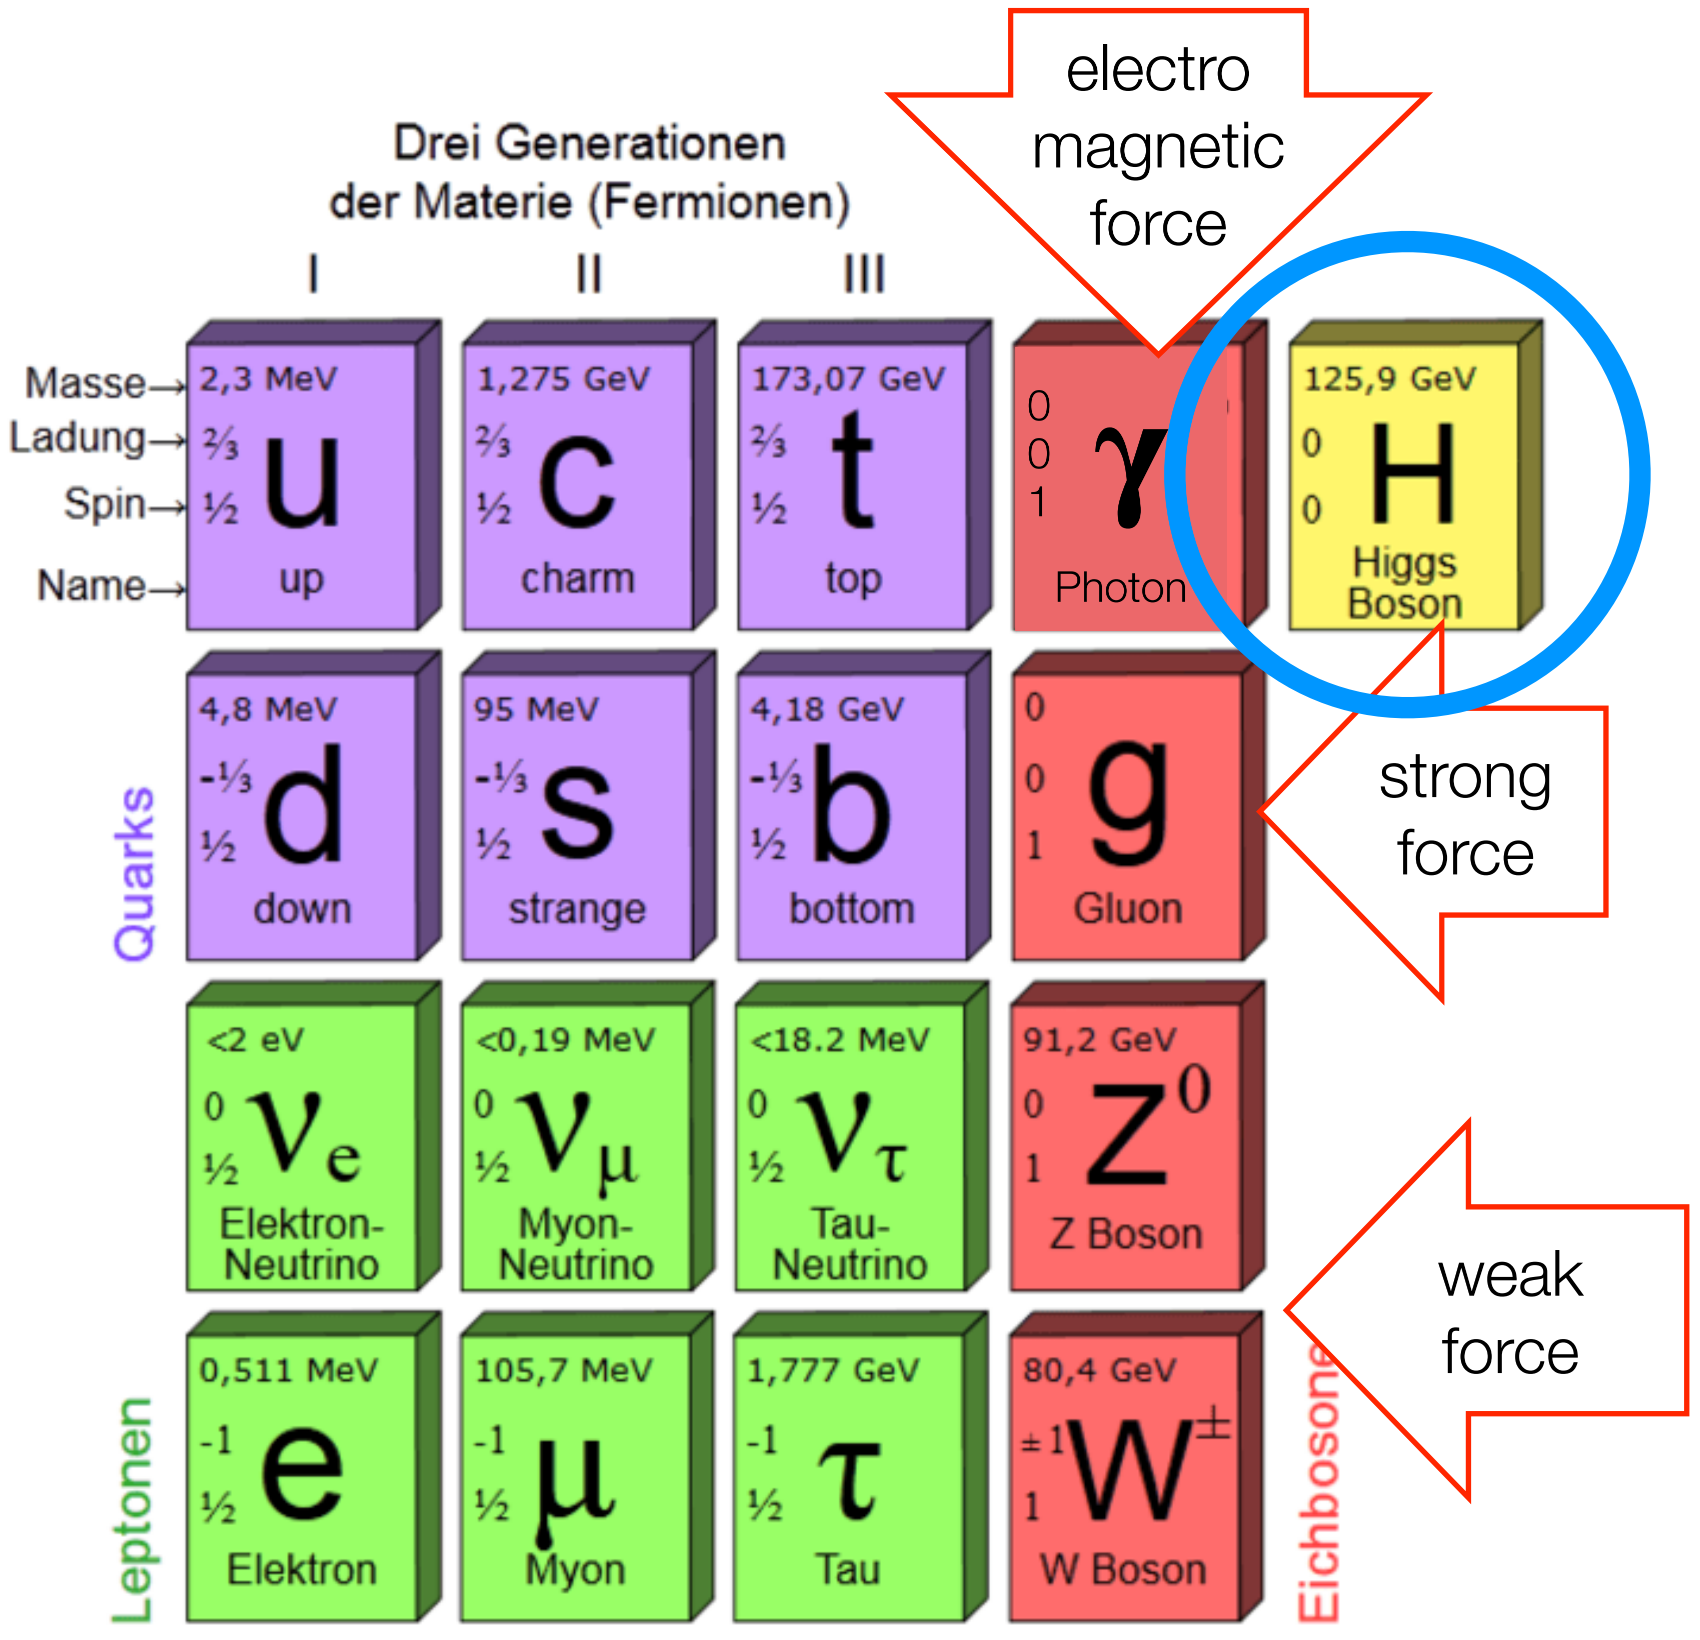


The Standard Model of Particle Physics

- describes (nearly) all measurements down to the level of quantum fluctuations
- based on only a few fundamental ideas:
  - special relativity
  - quantum mechanics
  - invariance under local gauge transformations: $SU(3) \times SU(2)_L \times U(1)_Y$

The Higgs Boson and the Standard Model of Particle Physics

A discovery which is only the beginning …



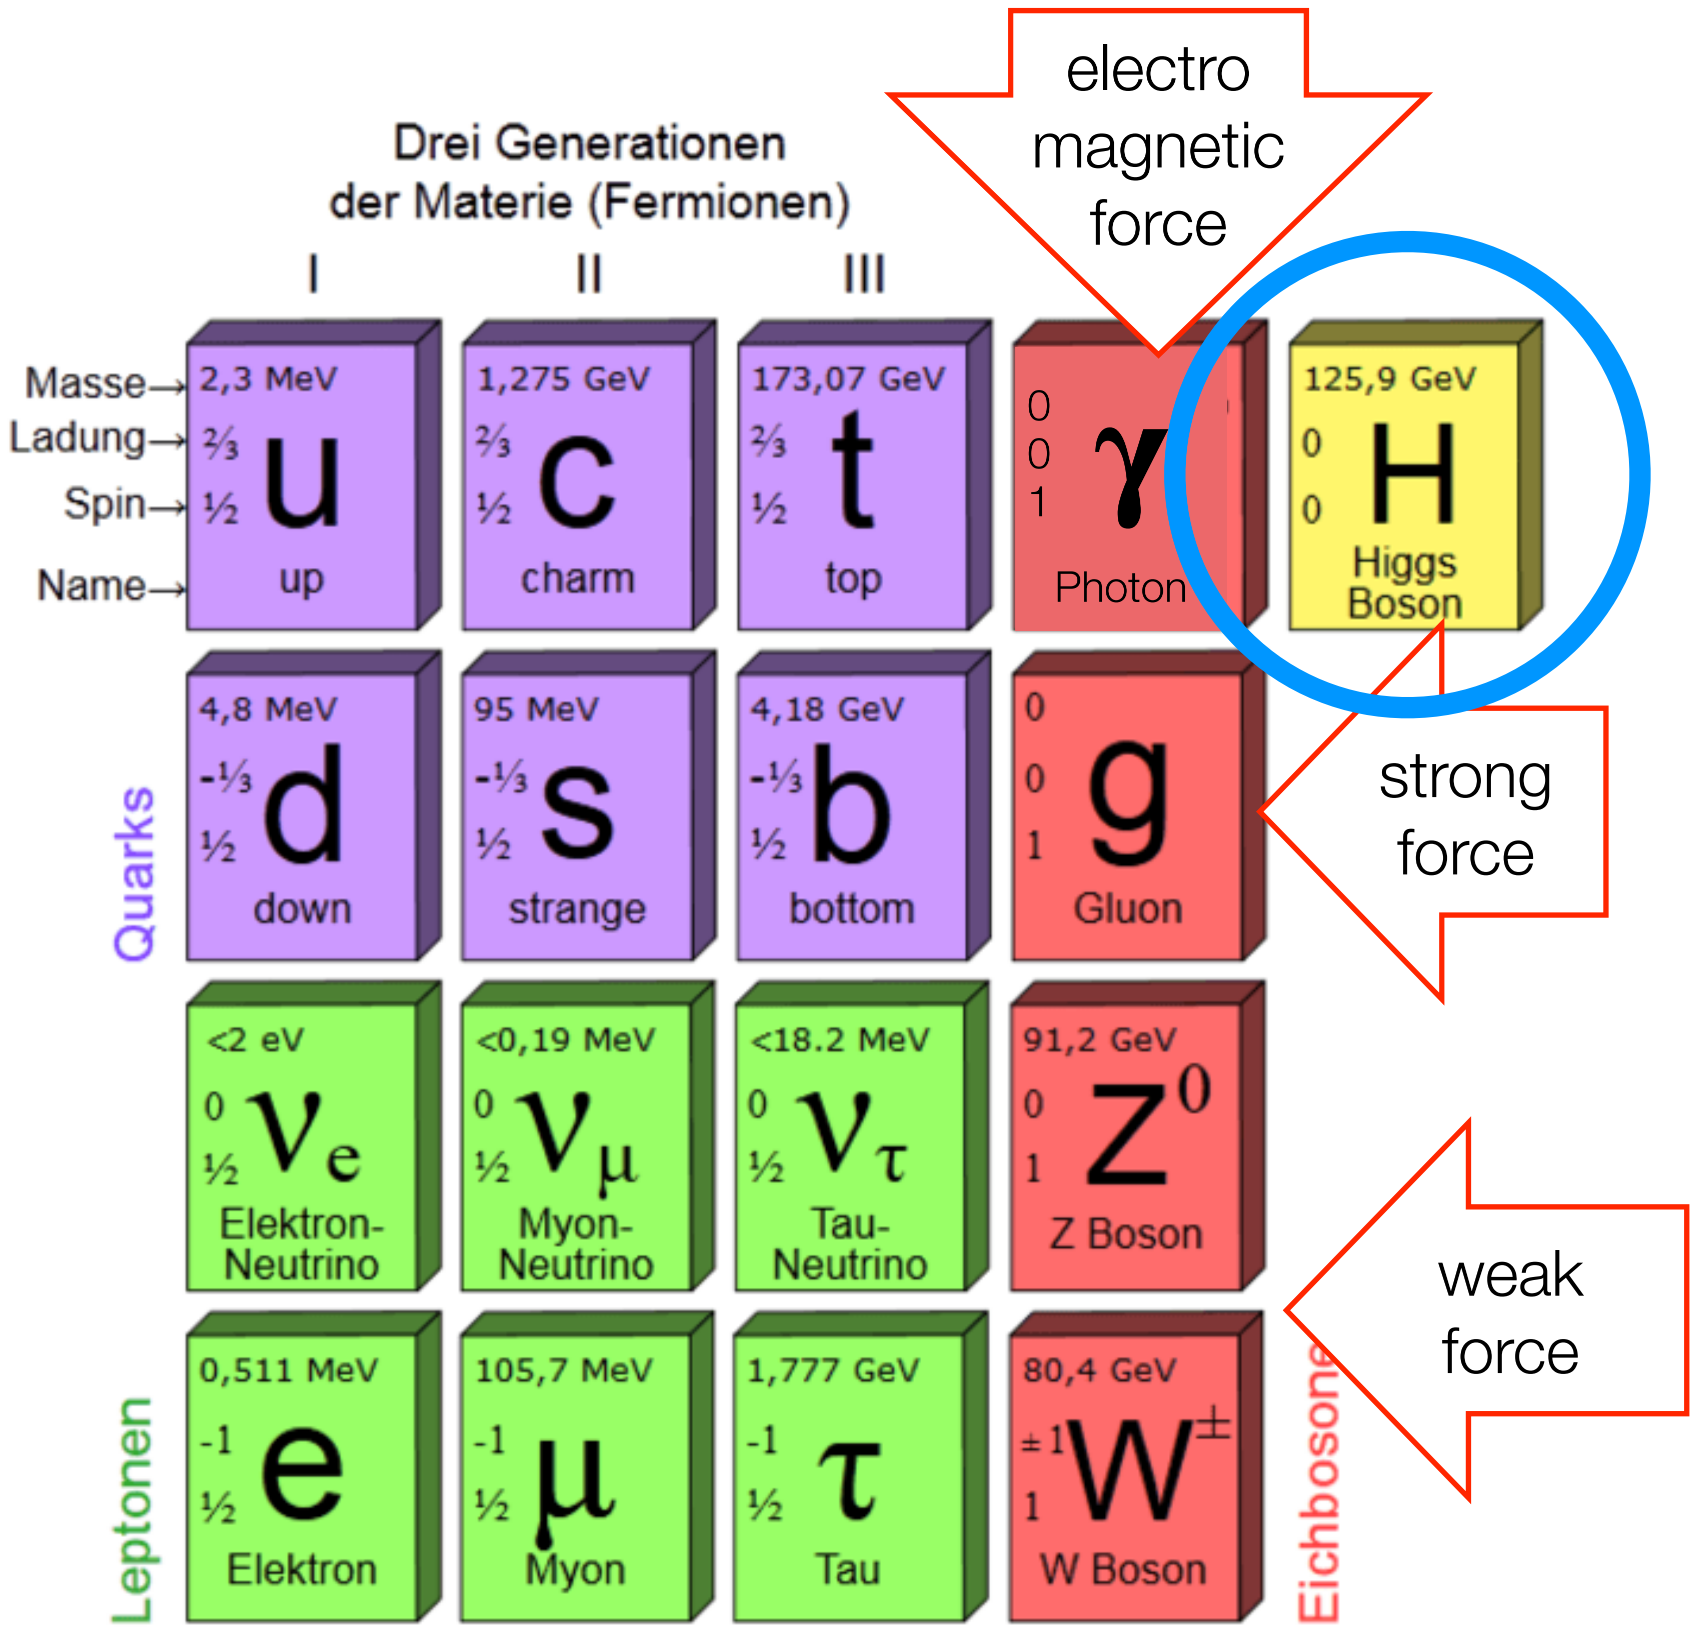
The Standard Model of Particle Physics

- describes (nearly) all measurements down to the level of quantum fluctuations
- based on only a few fundamental ideas:
  - special relativity
  - quantum mechanics
  - invariance under local gauge transformations

2012: Discovery of a Higgs bosons at the LHC!

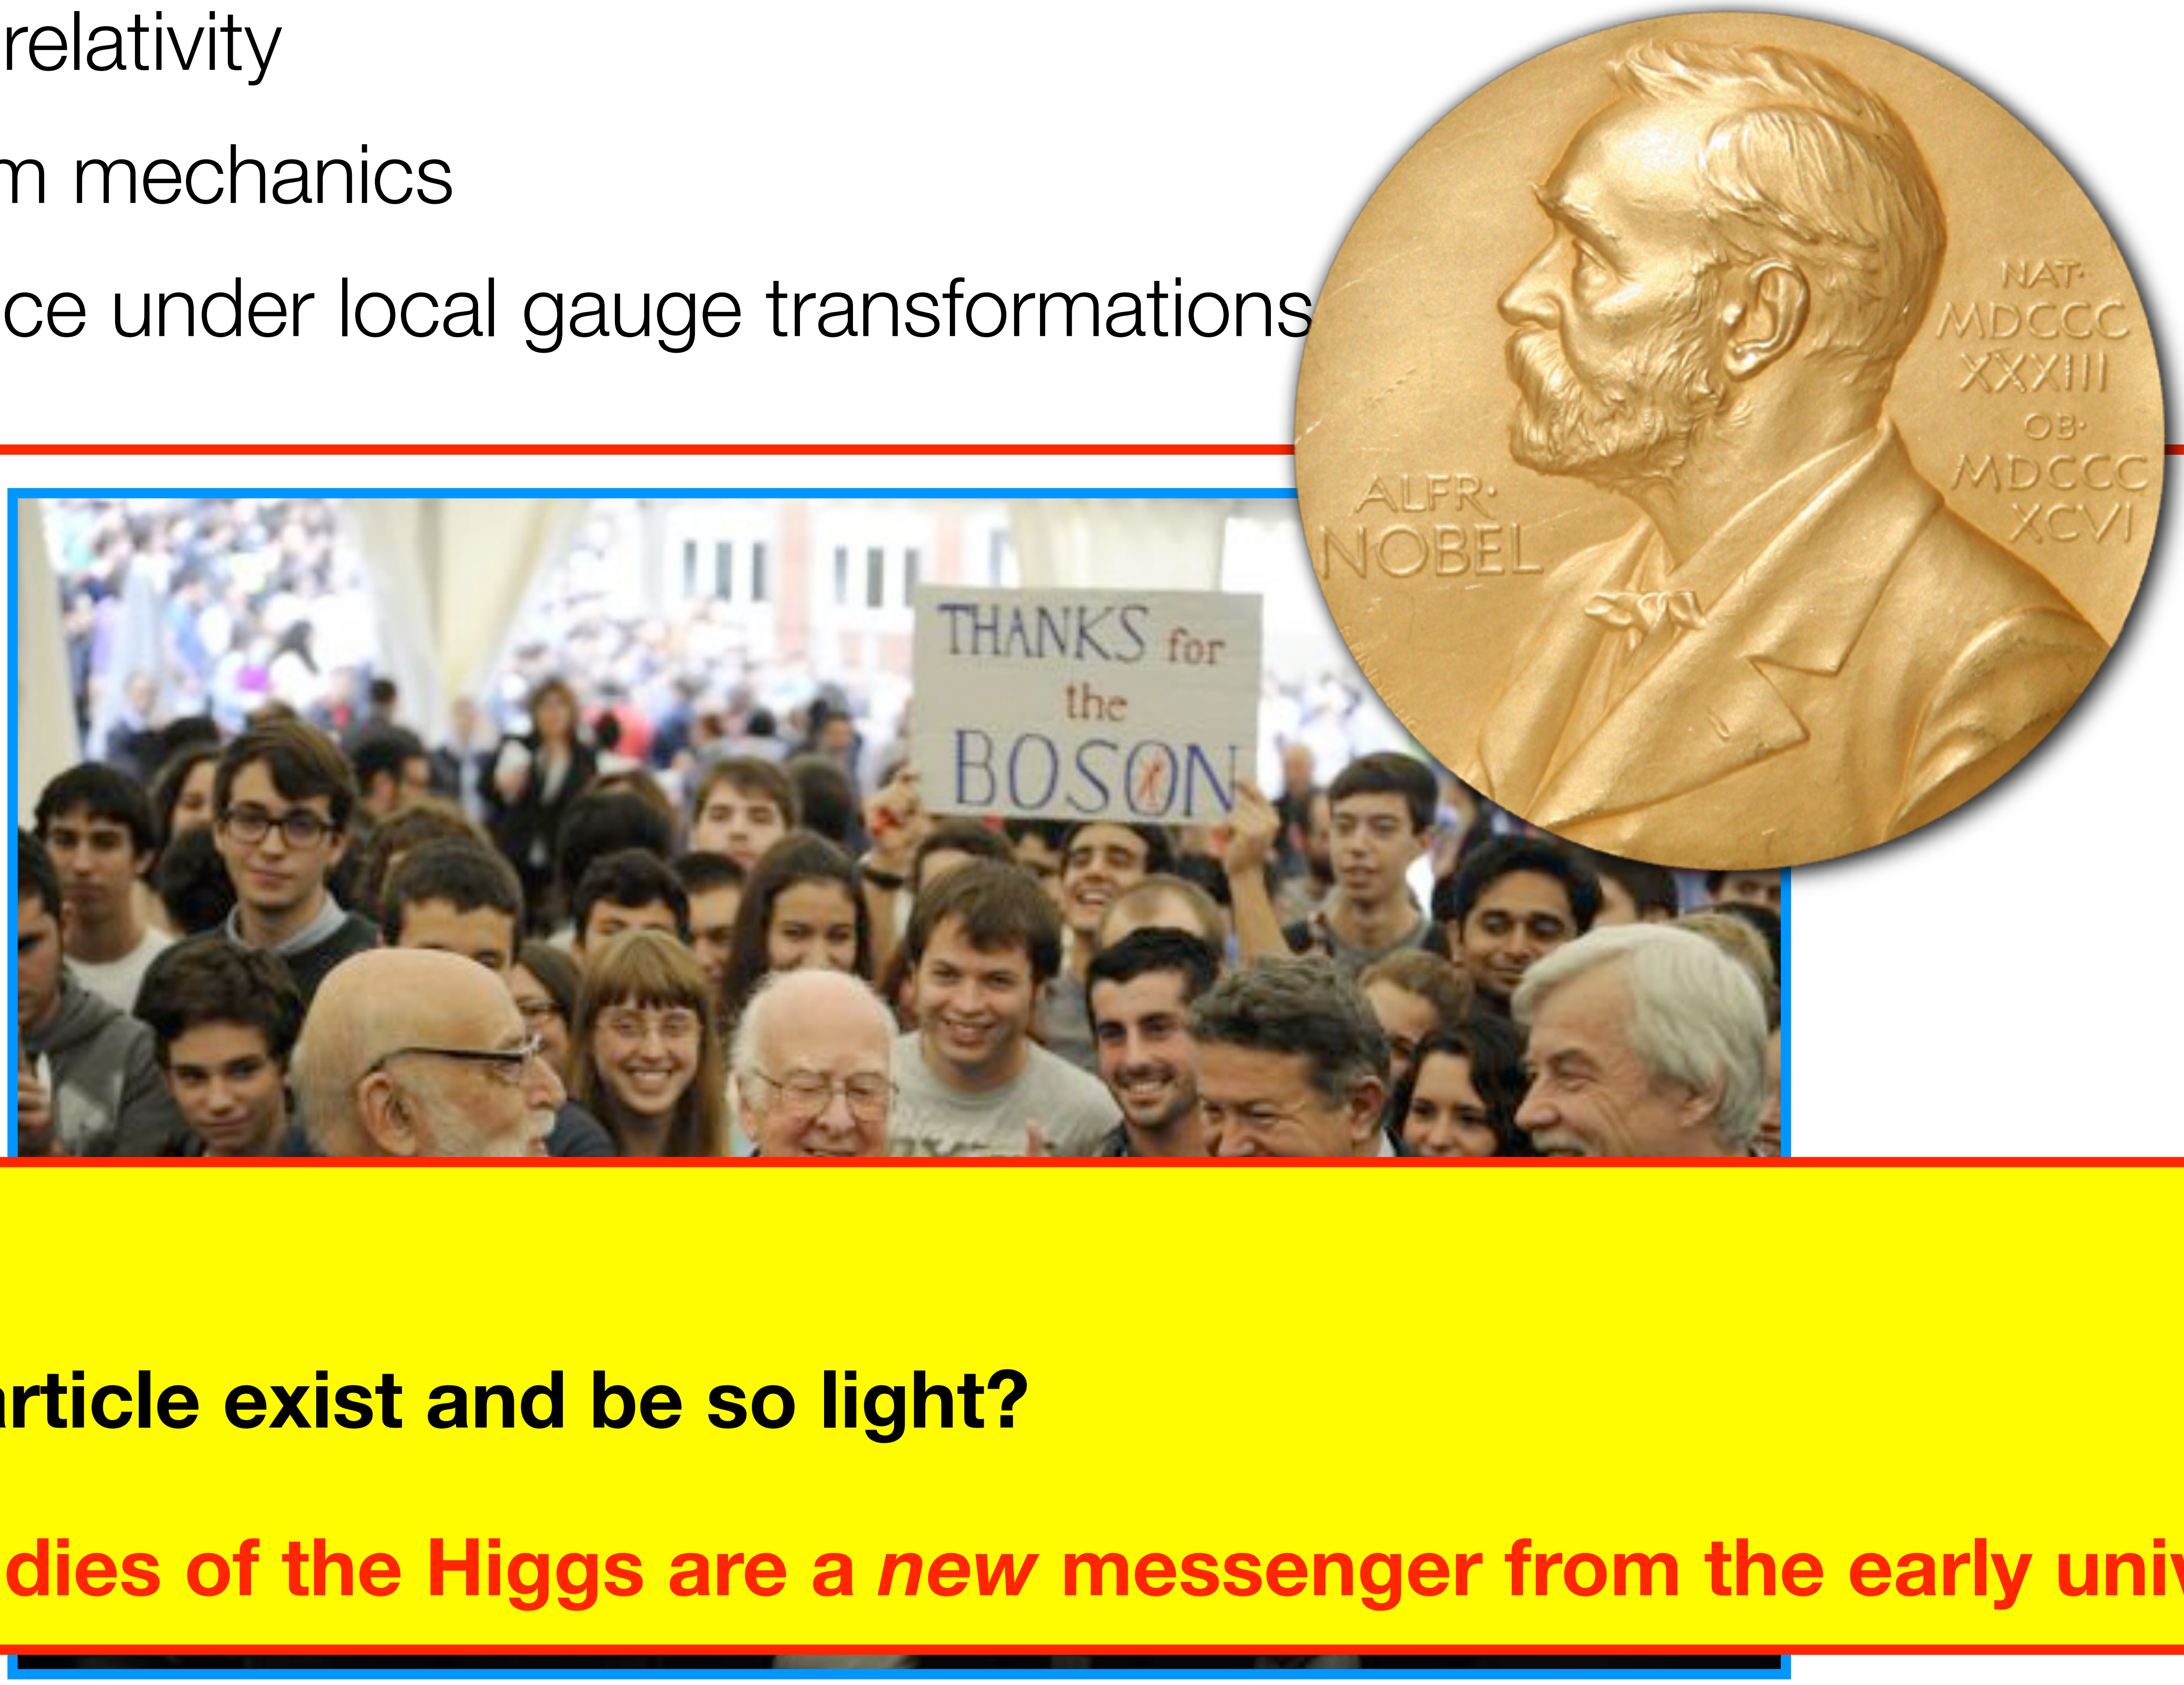
The Higgs Boson and the Standard Model of Particle Physics

A discovery which is only the beginning …



The Standard Model of Particle Physics

- describes (nearly) all measurements down to the level of quantum fluctuations
- based on only a few fundamental ideas:
  - special relativity
  - quantum mechanics
  - invariance under local gauge transformations

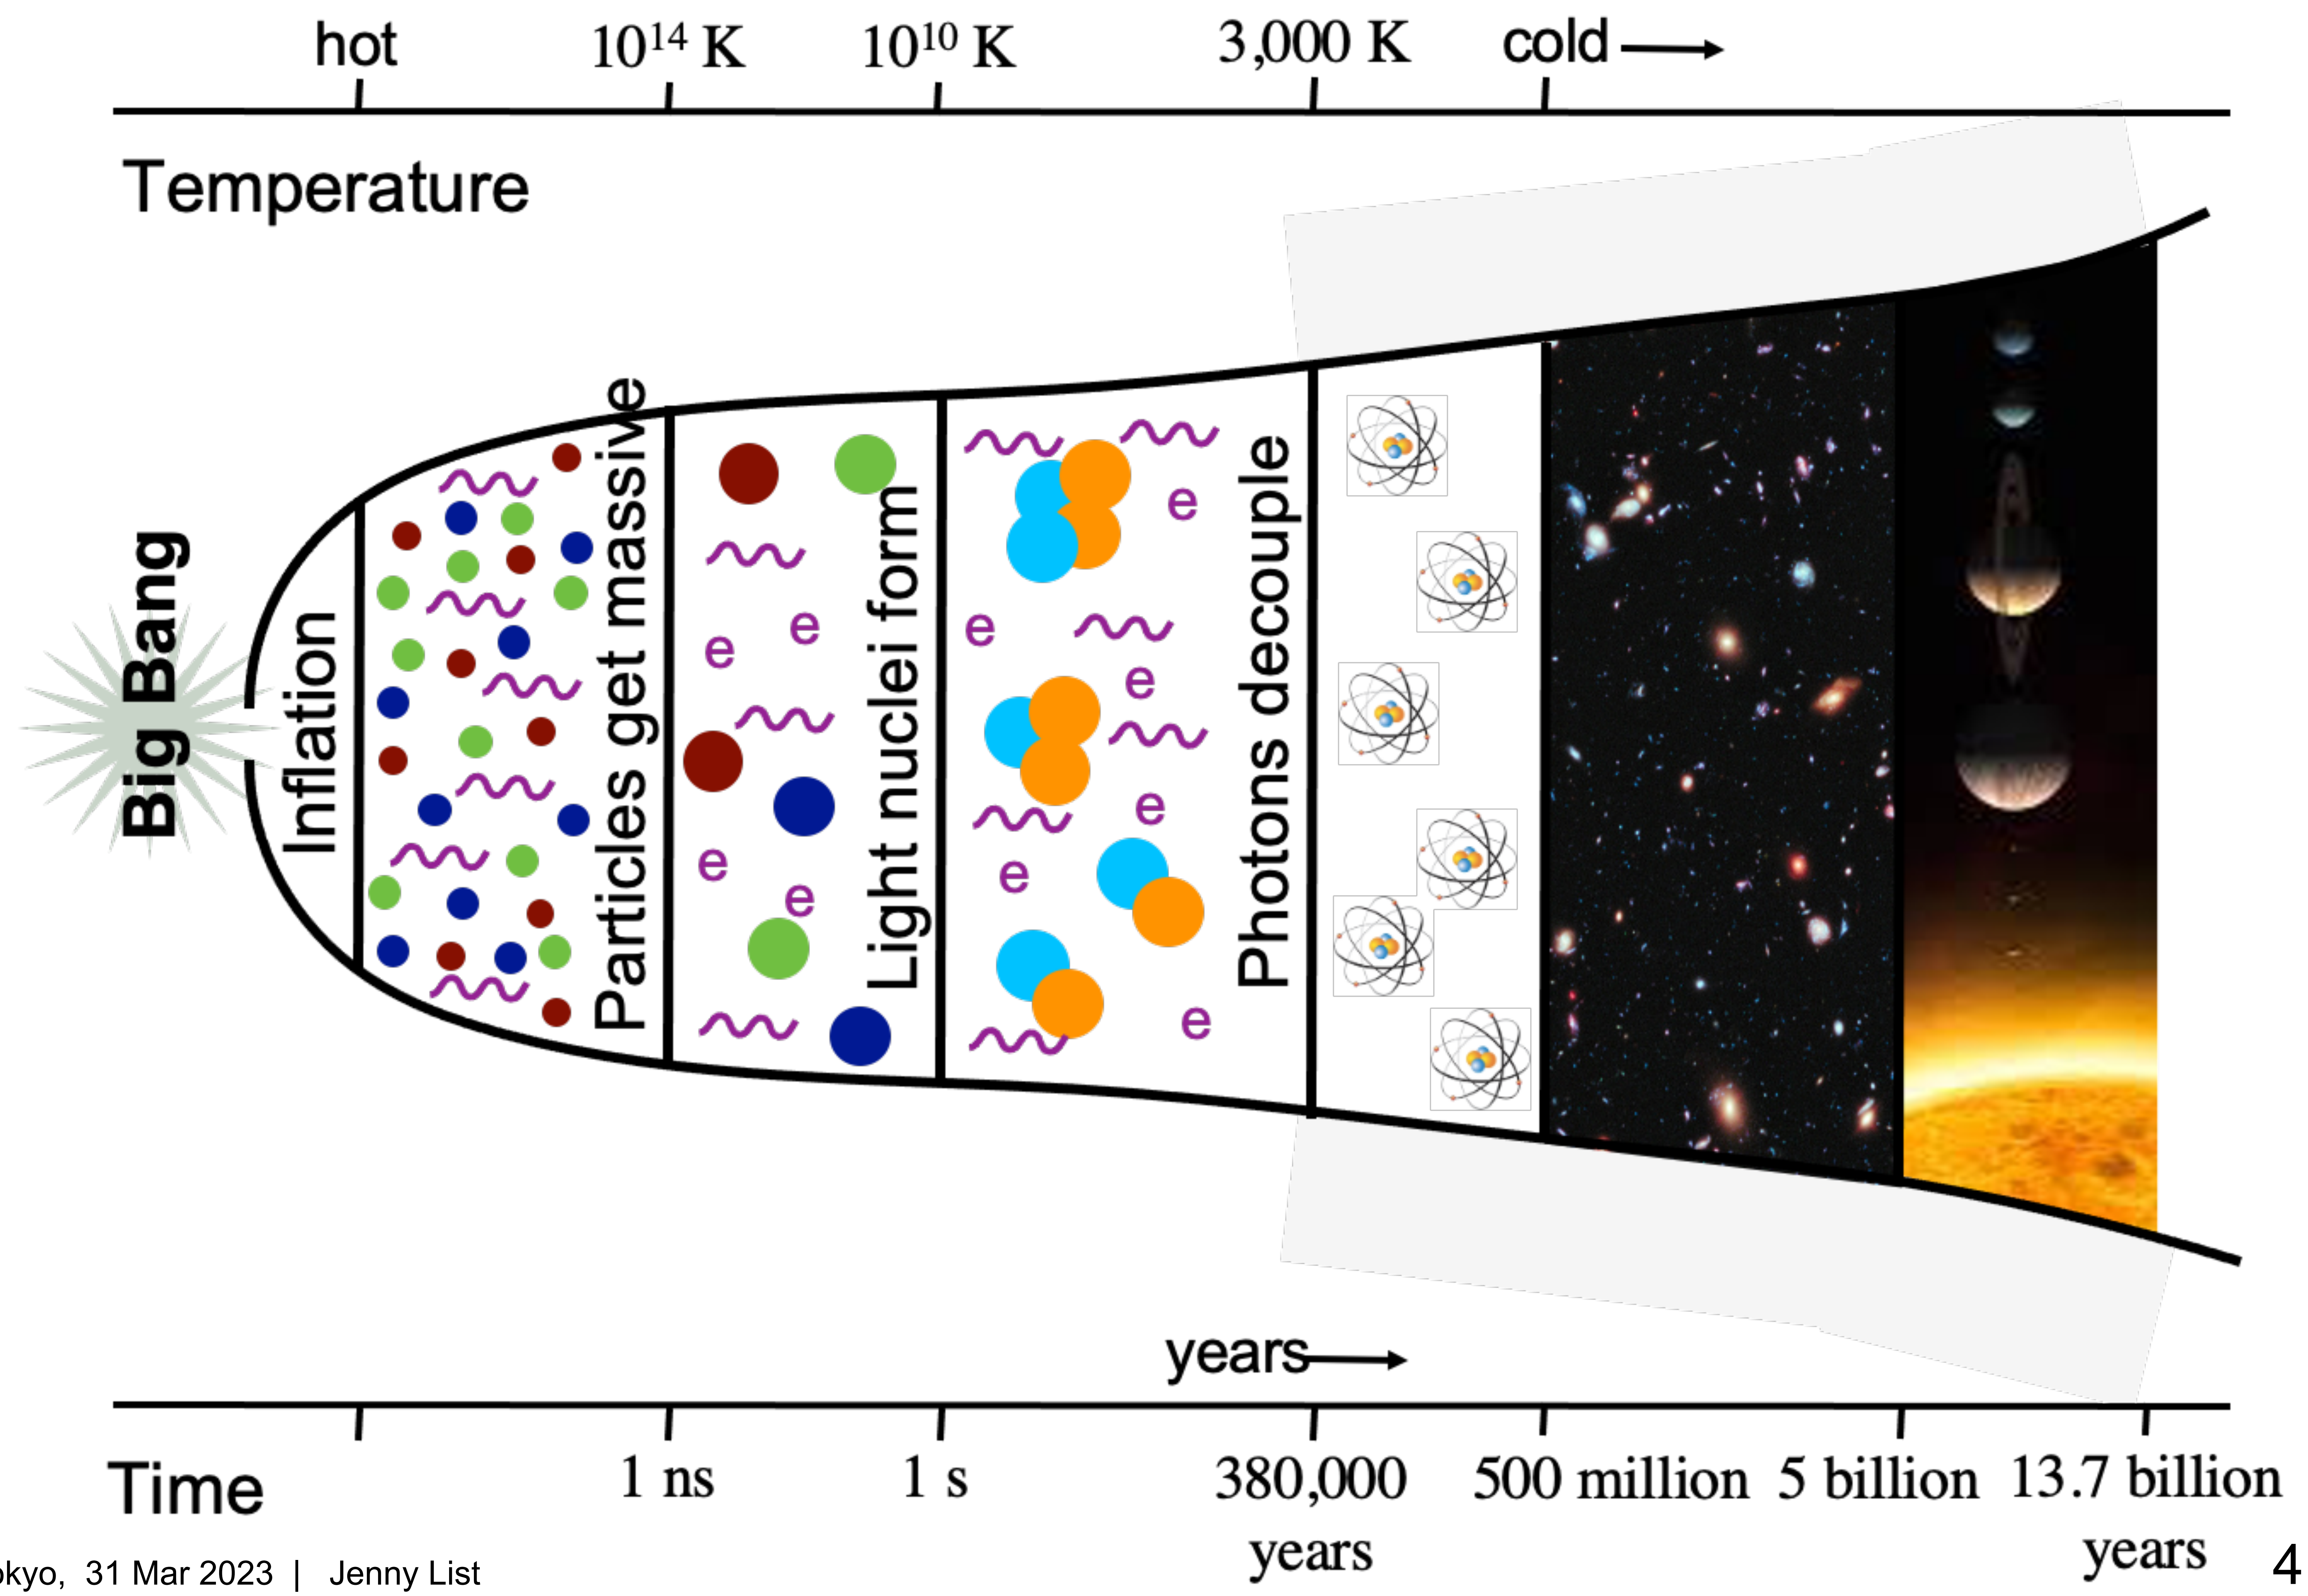


Are we done? — No! — The Higgs Boson is

1. **a mystery in itself: how can an elementary spin-0 particle exist and be so light?**
2. **intimately connected to cosmology => precision studies of the Higgs are a *new* messenger from the early universe!**

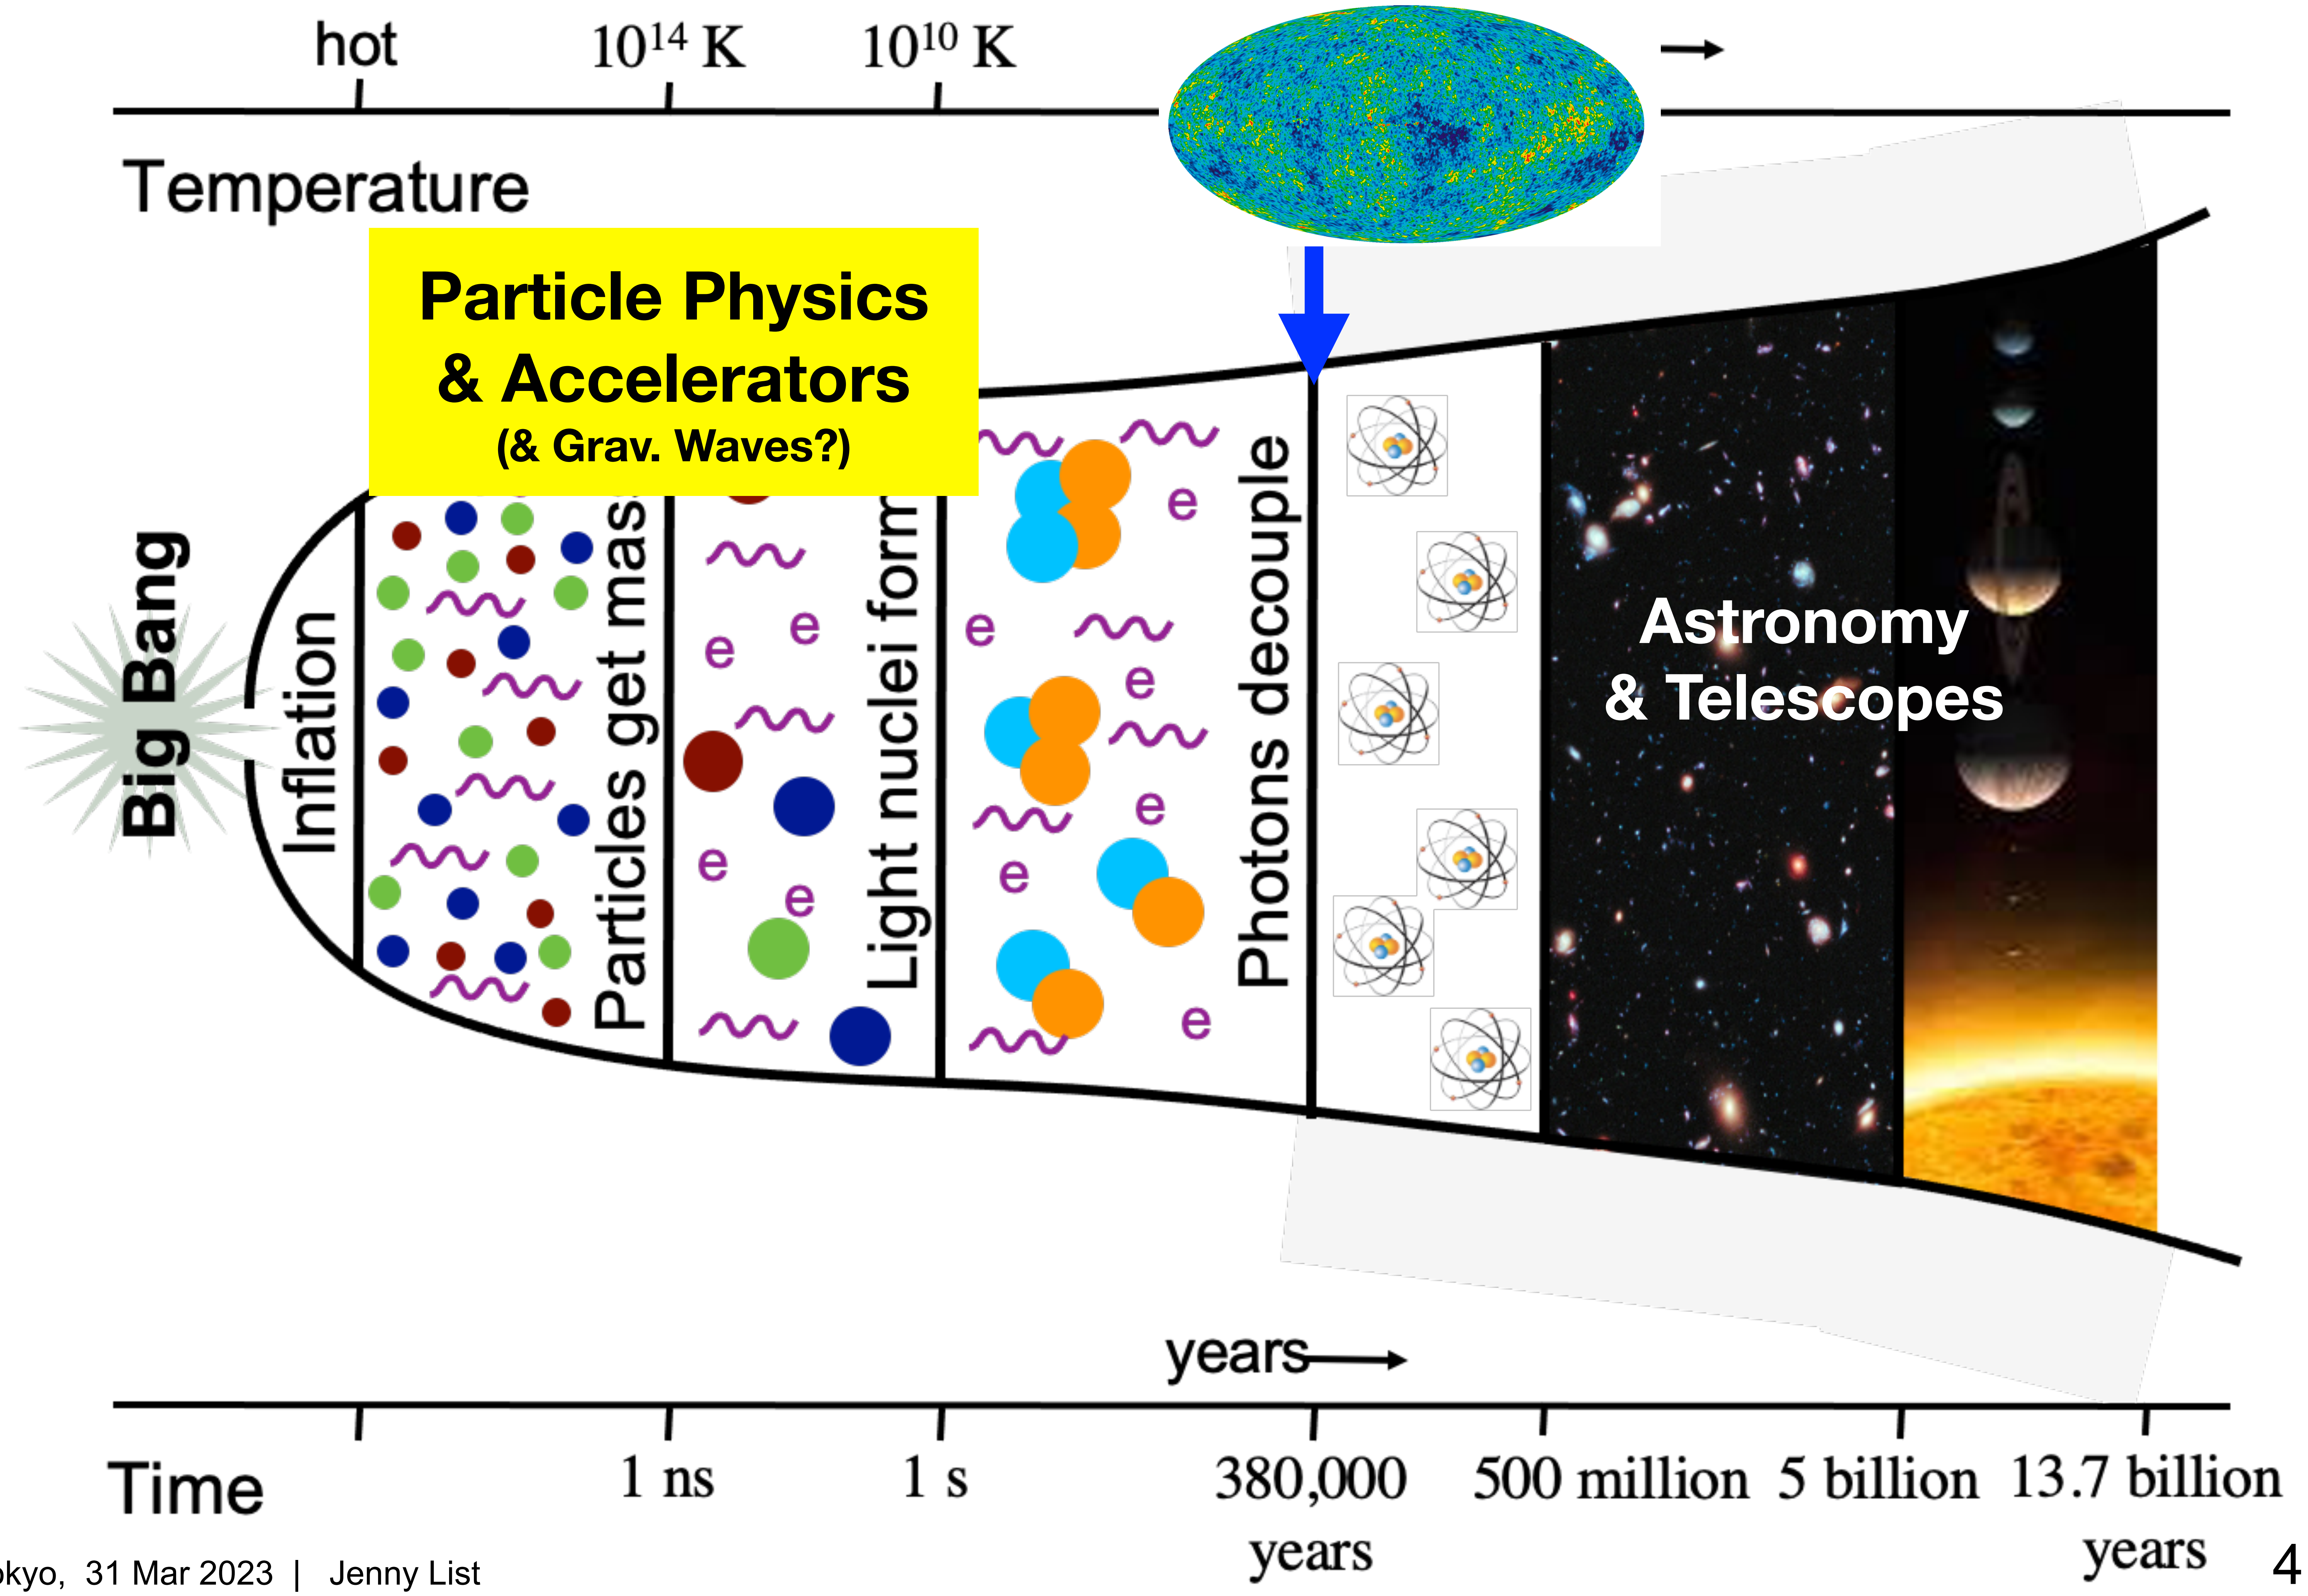
A new messenger from the early universe

The Higgs Boson



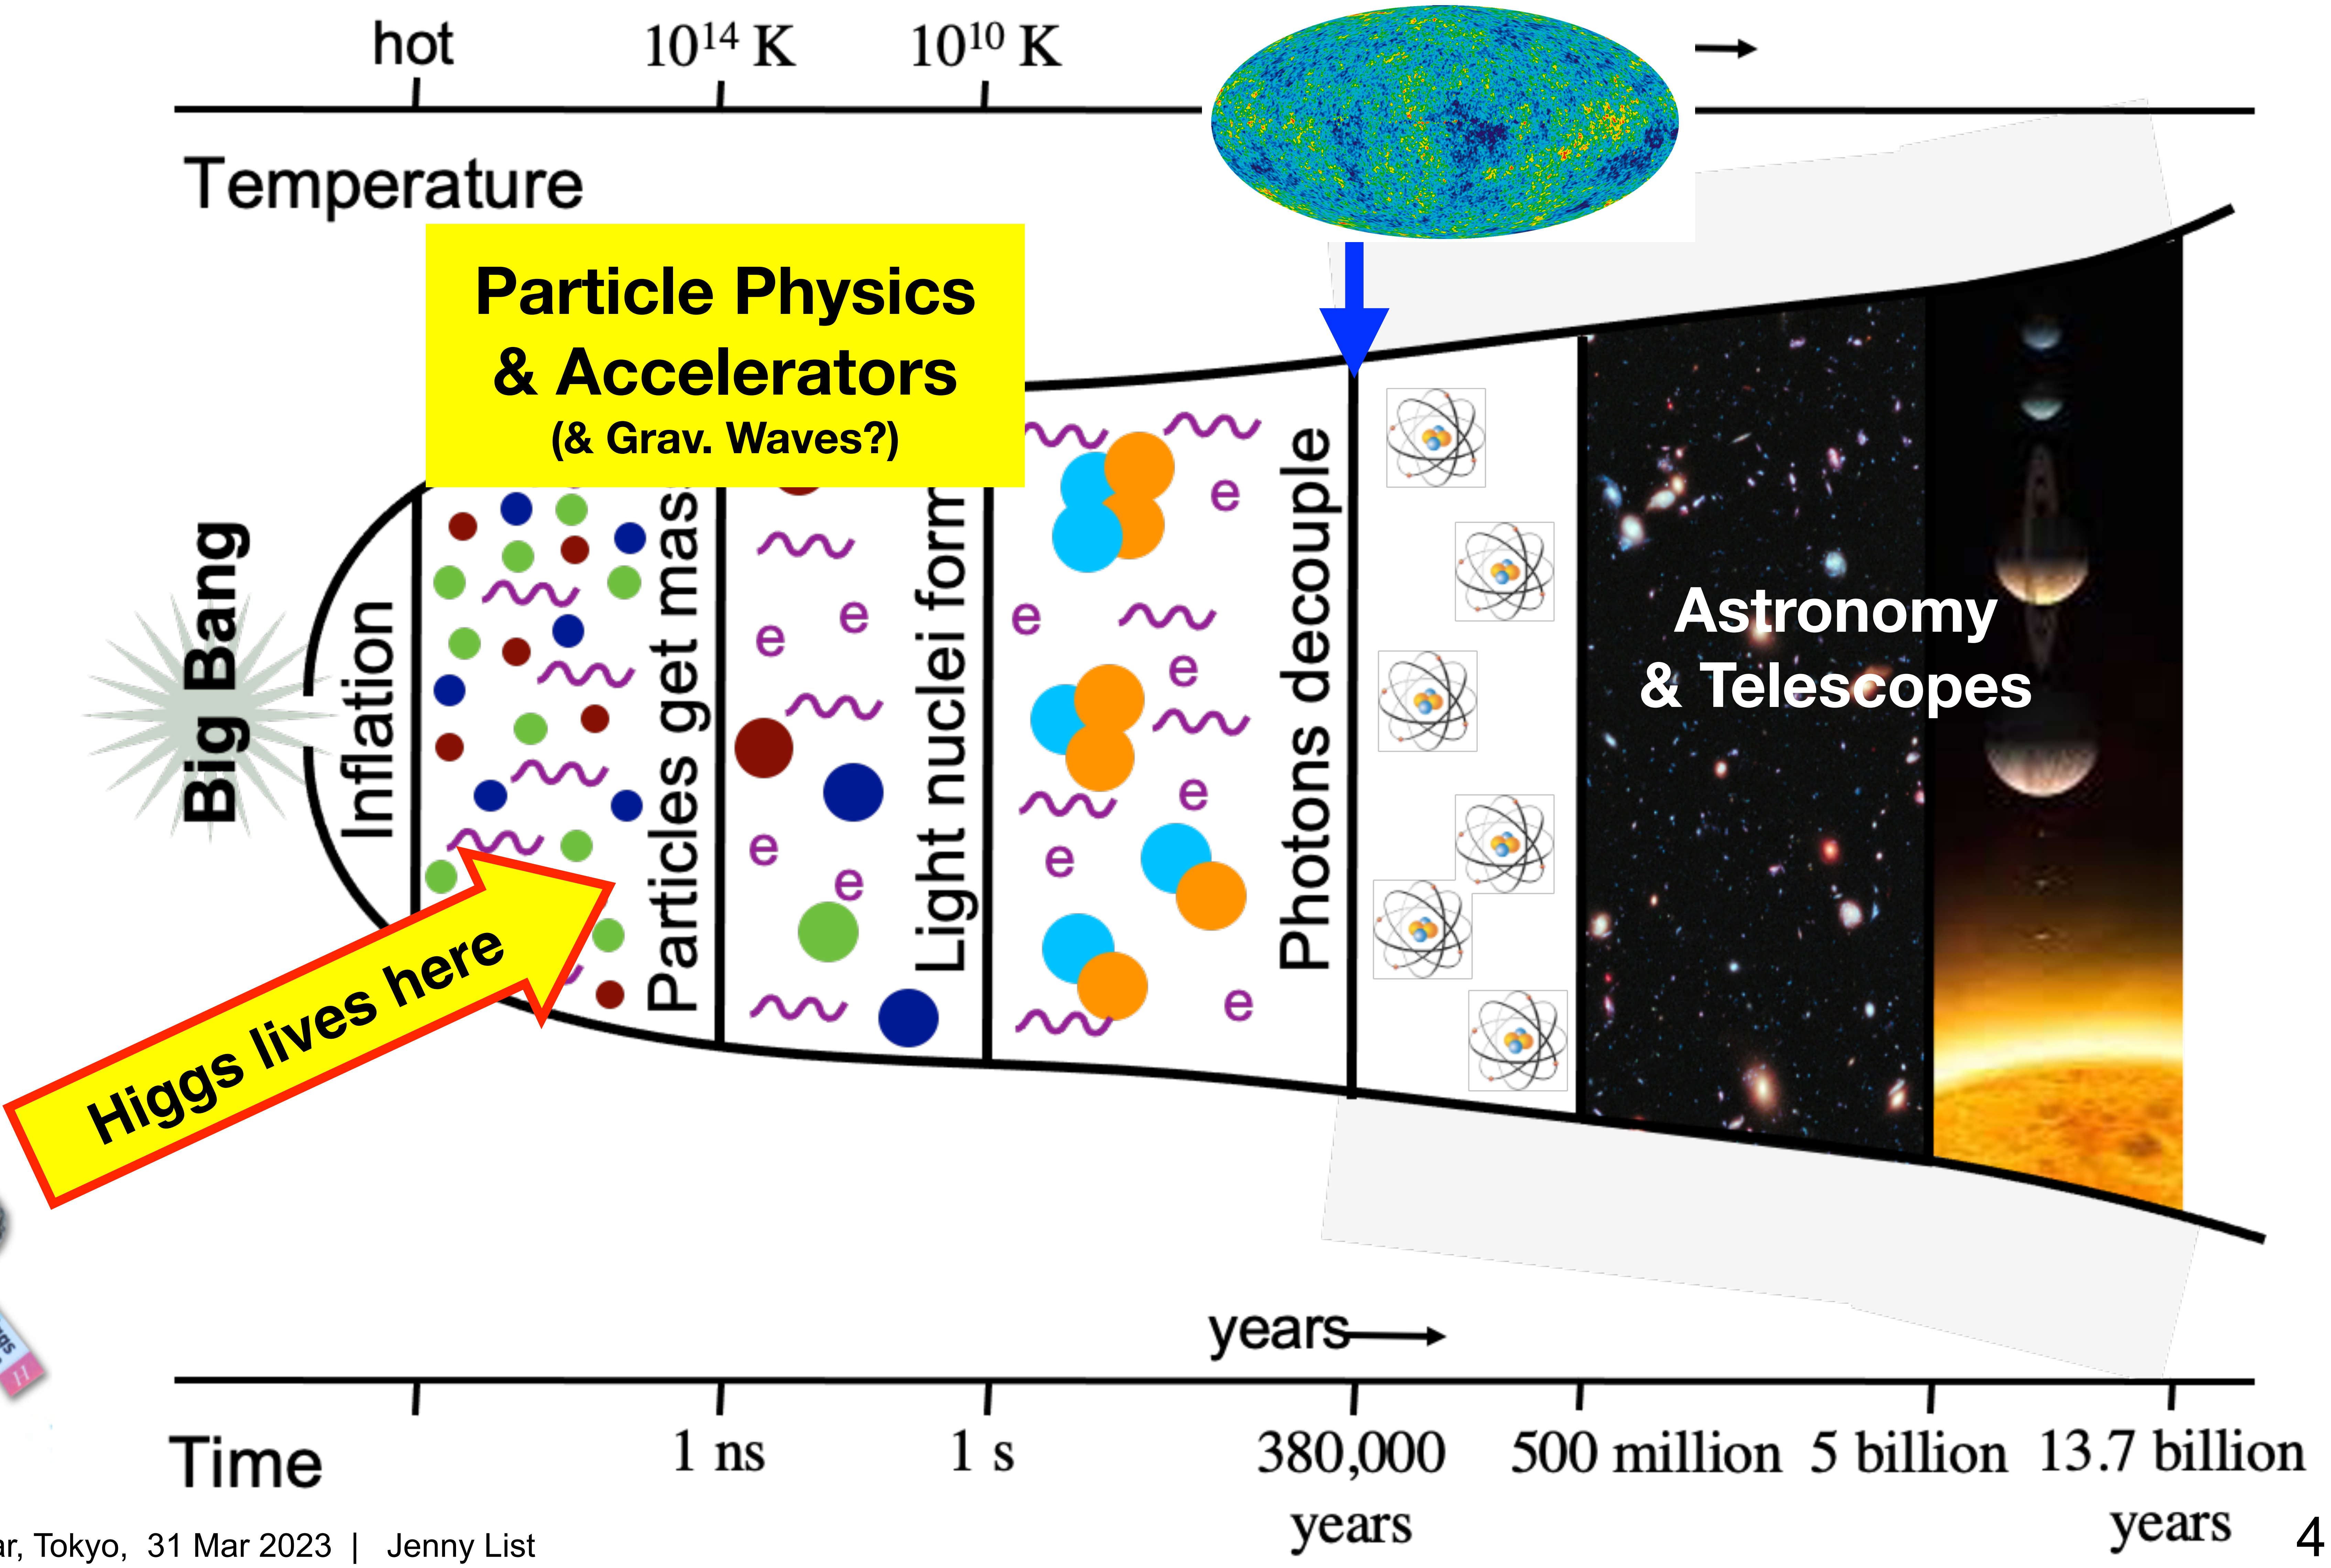
A new messenger from the early universe

The Higgs Boson



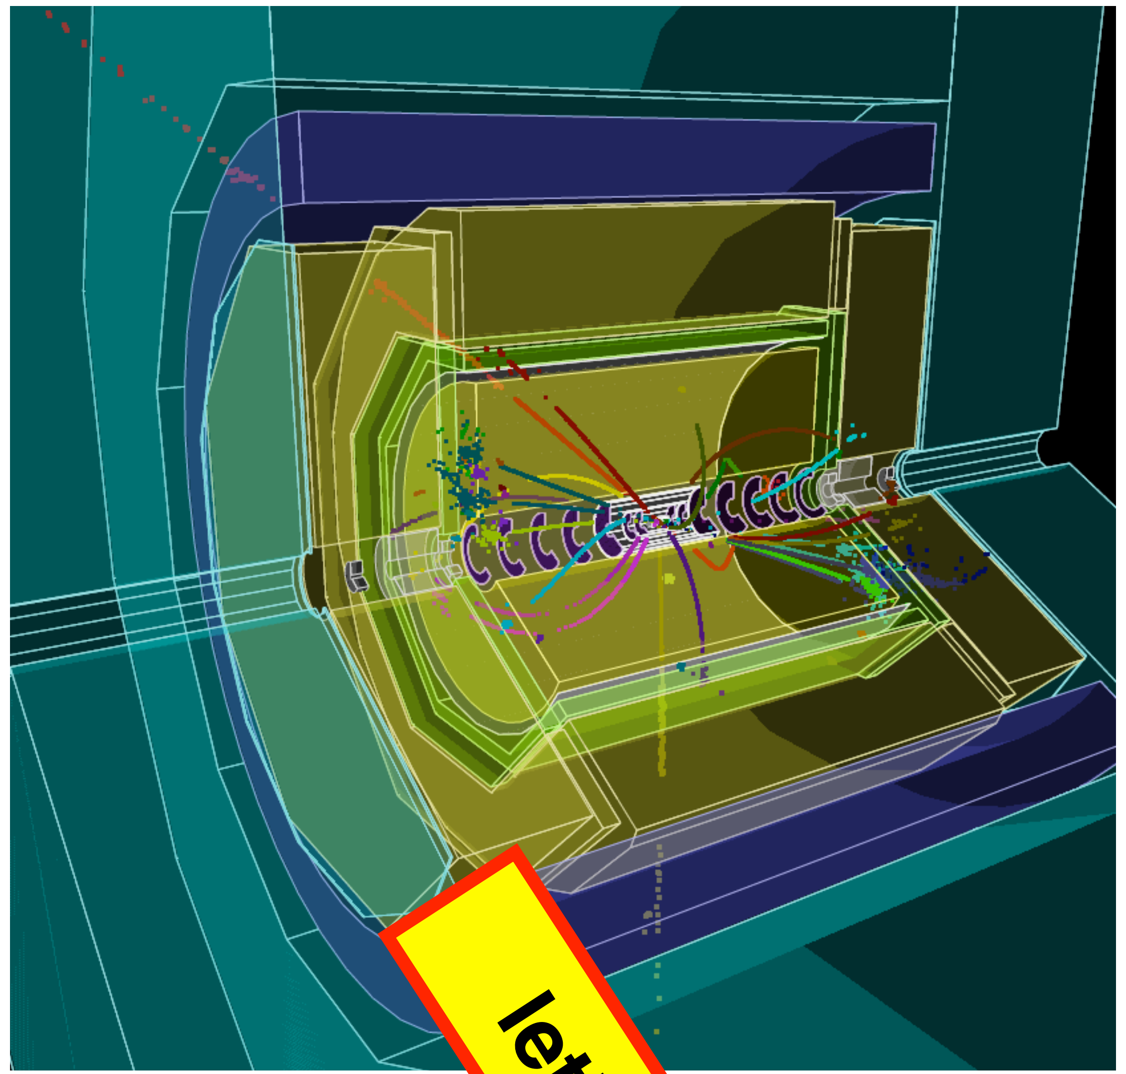
A new messenger from the early universe

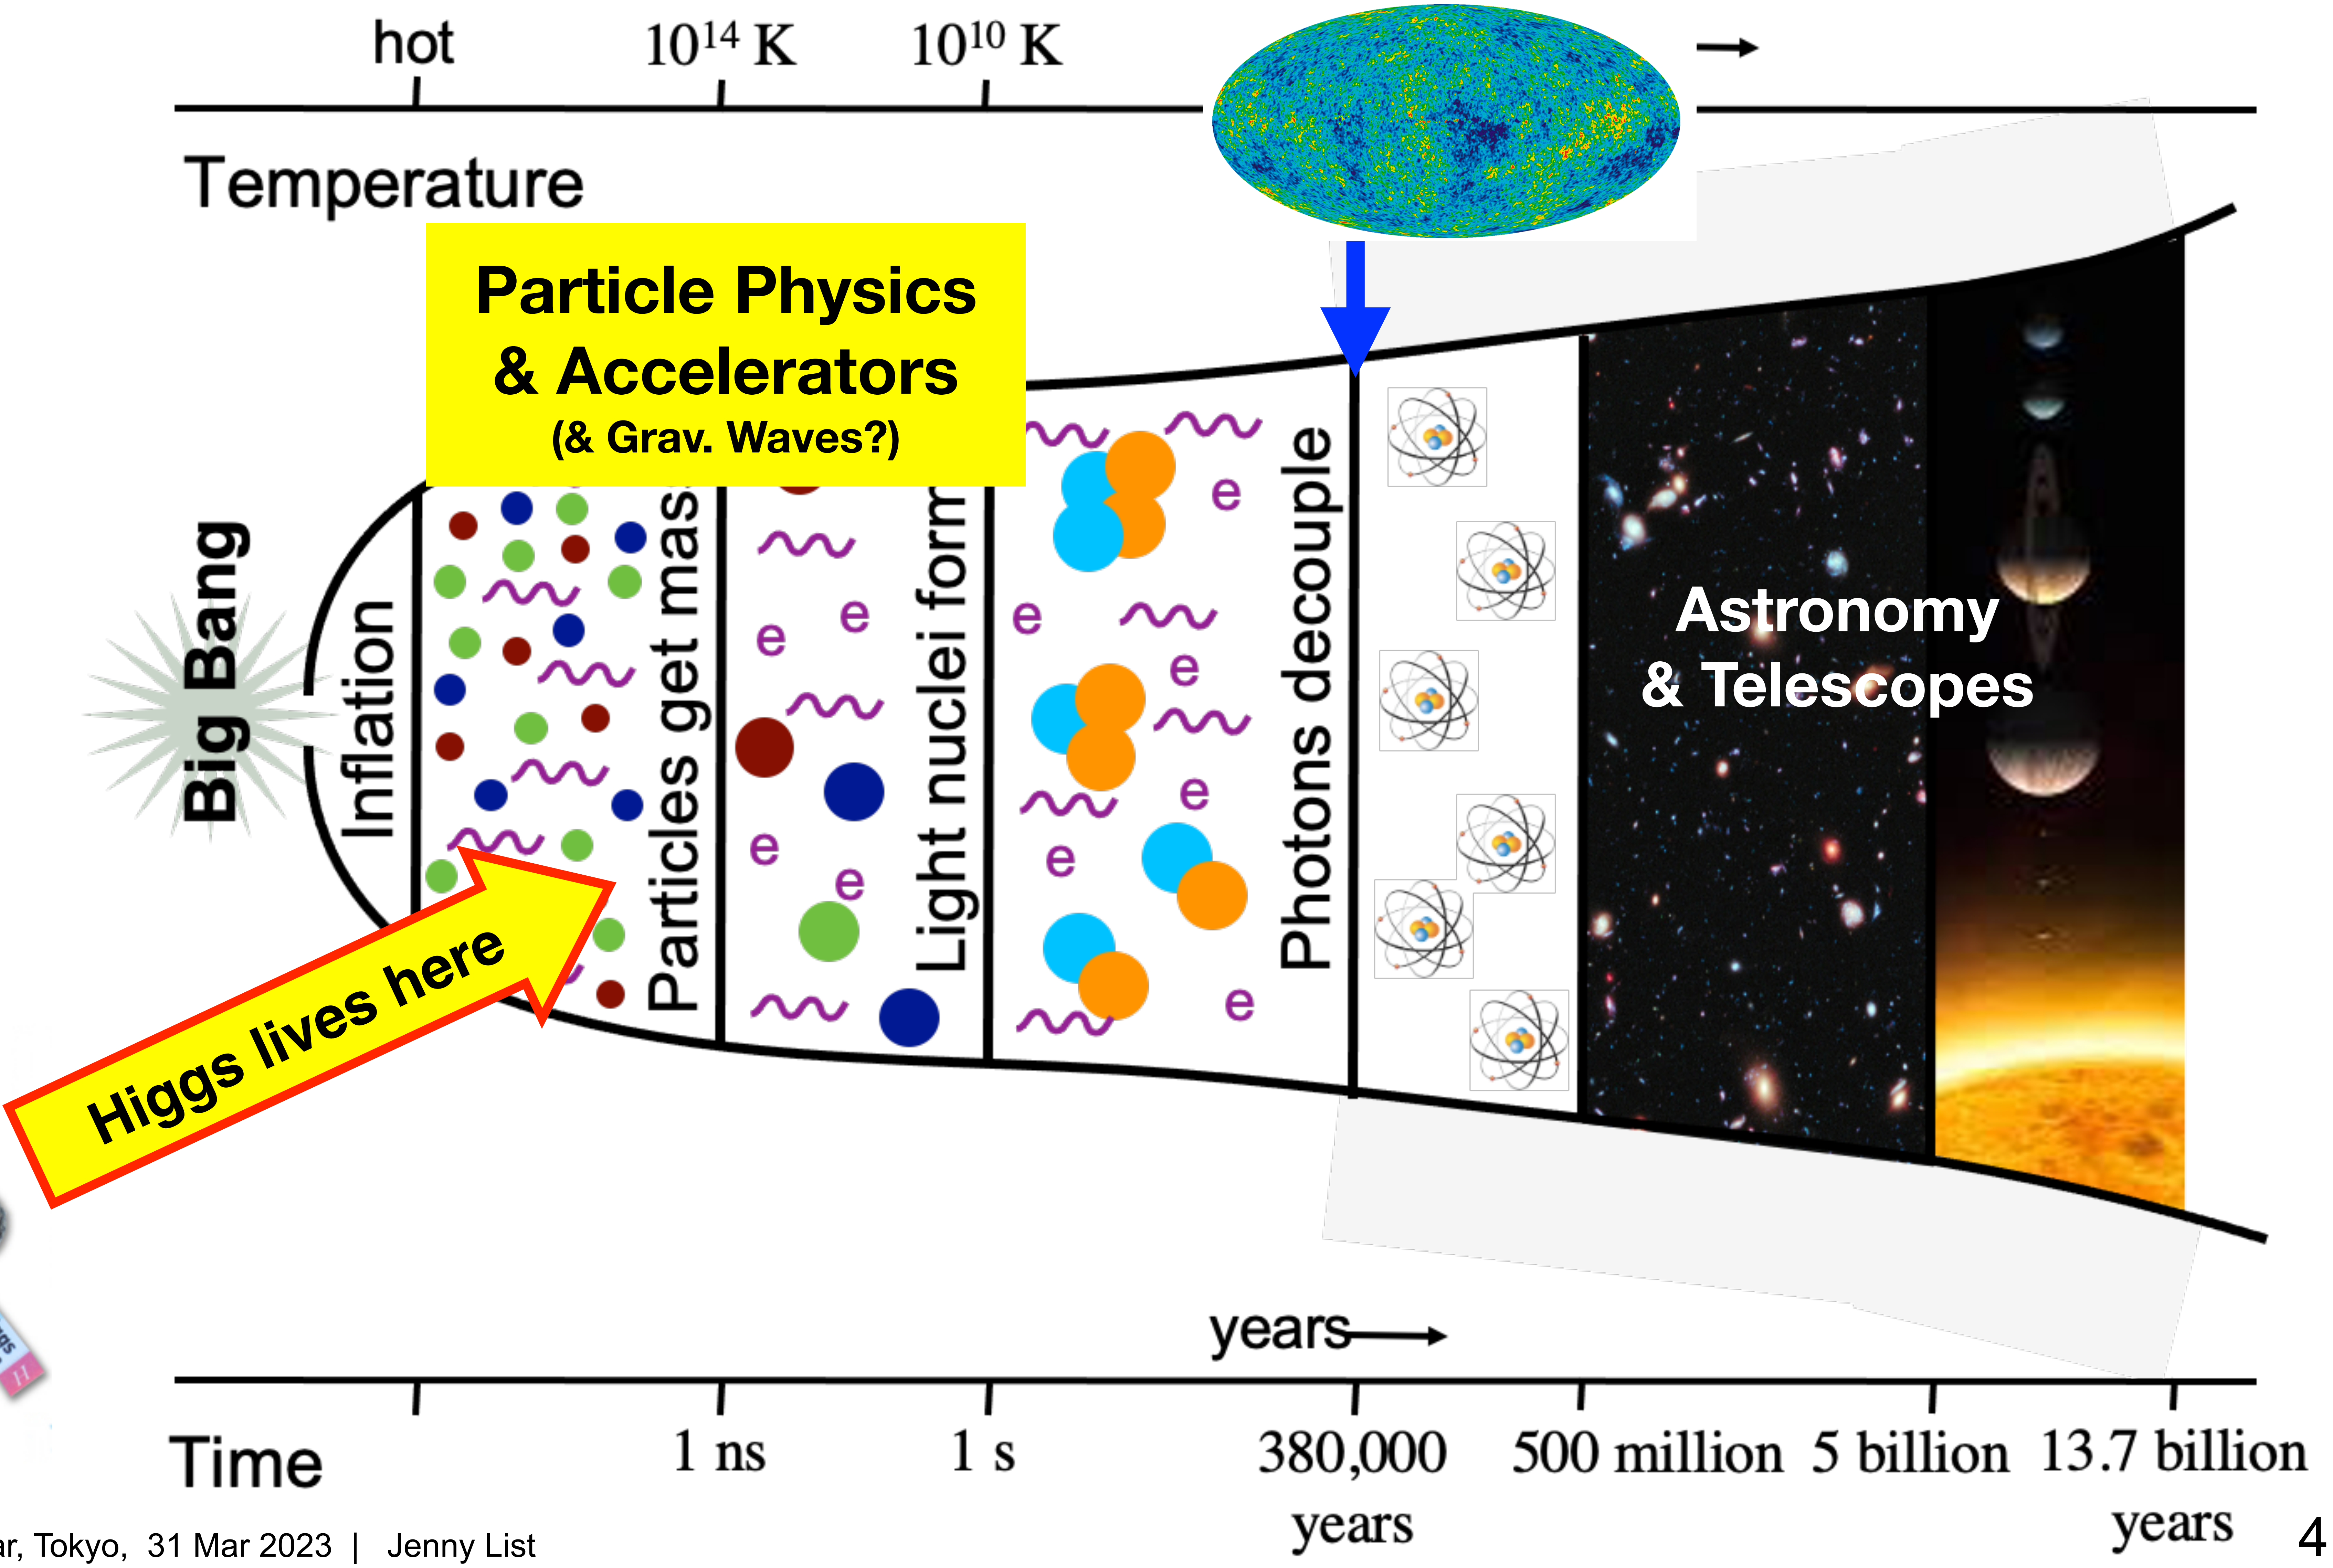
The Higgs Boson



A new messenger from the early universe

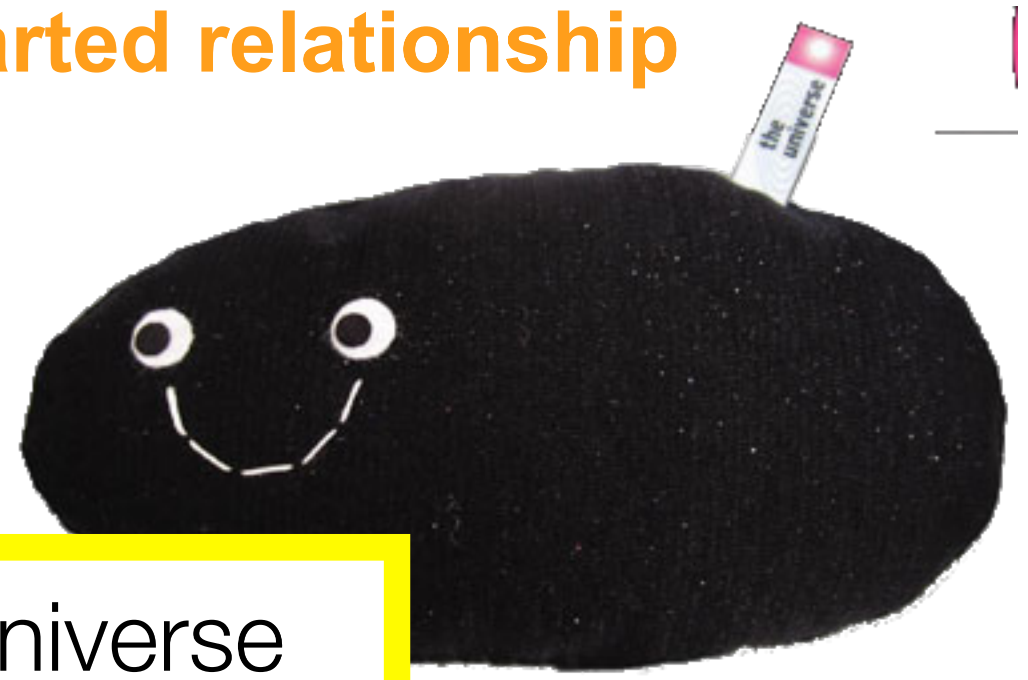
The Higgs Boson





The Higgs Boson and the Universe

Exploration of an uncharted relationship

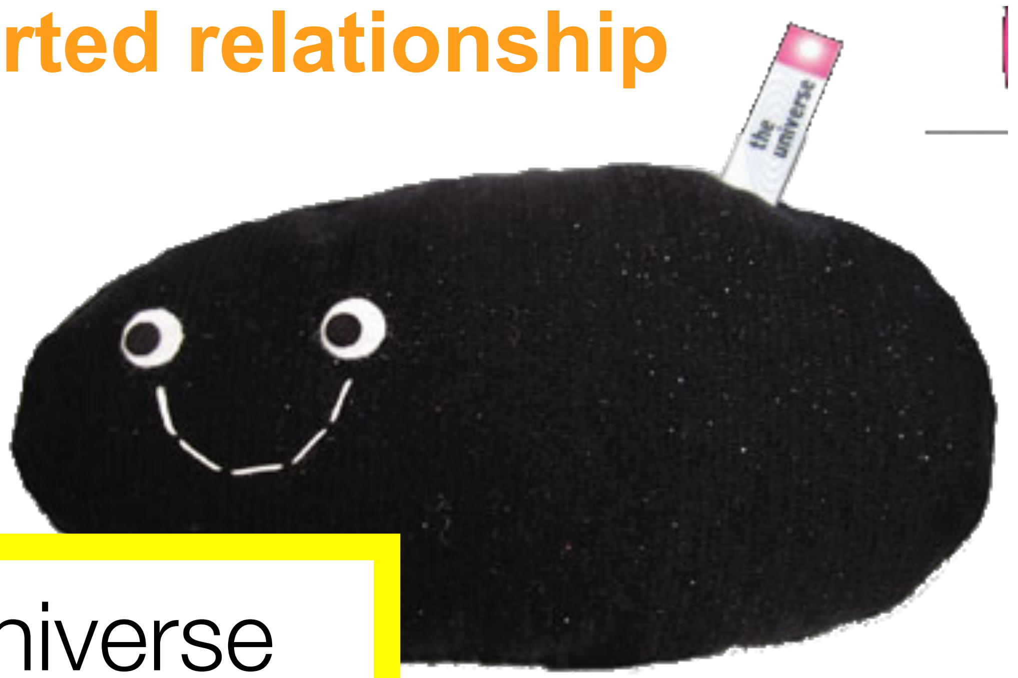


What we'd really like to know

- What is Dark Matter made out of?
- What drove cosmic inflation?
- What generates the mass pattern in quark and lepton sectors?
- What created the matter-antimatter asymmetry?
- What drove electroweak phase transition?
  - **and could it play a role in baryogenesis?**
- …

The Higgs Boson and the Universe

Exploration of an uncharted relationship



The Universe

The Higgs Boson

What we'd really like to know

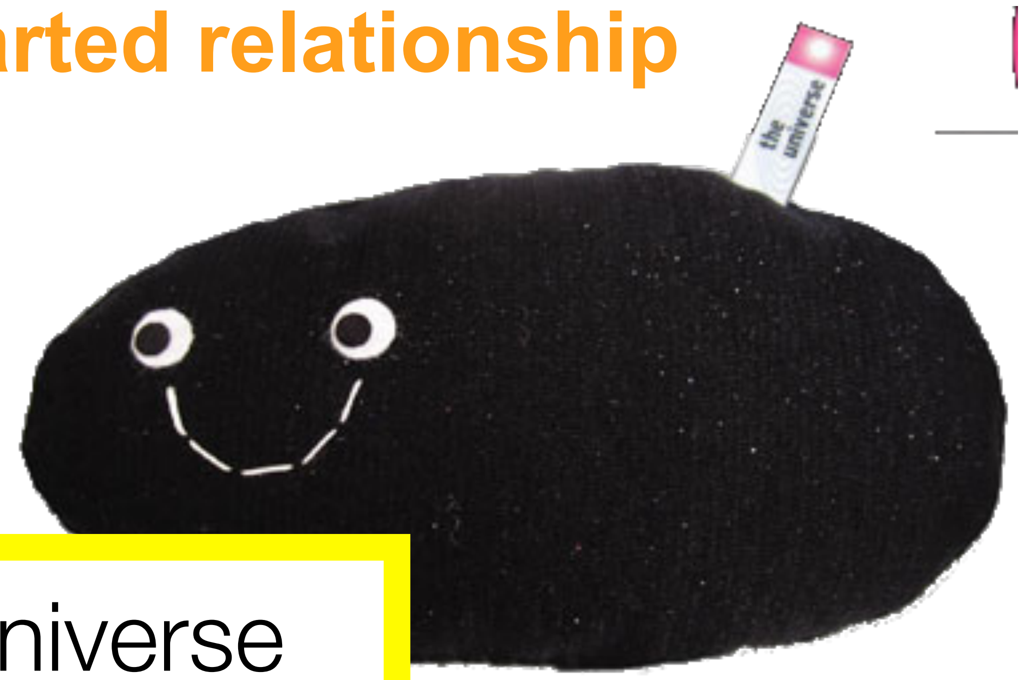
- What is Dark Matter made out of?
- What drove cosmic inflation?
- What generates the mass pattern in quark and lepton sectors?
- What created the matter-antimatter asymmetry?
- What drove electroweak phase transition?
  - **and could it play a role in baryogenesis?**
- …

Is the Higgs the portal to the Dark Sector?

- does the Higgs decays "invisibly", i.e. to dark sector particles?
- does the Higgs have siblings in the dark (or the visible) sector?

The Higgs Boson and the Universe

Exploration of an uncharted relationship



The Universe

The Higgs Boson

What we’d really like to know

- What is Dark Matter made out of?
- What drove cosmic inflation?
- What generates the mass pattern in quark and lepton sectors?
- What created the matter-antimatter asymmetry?
- What drove electroweak phase transition?
  - **and could it play a role in baryogenesis?**
- …

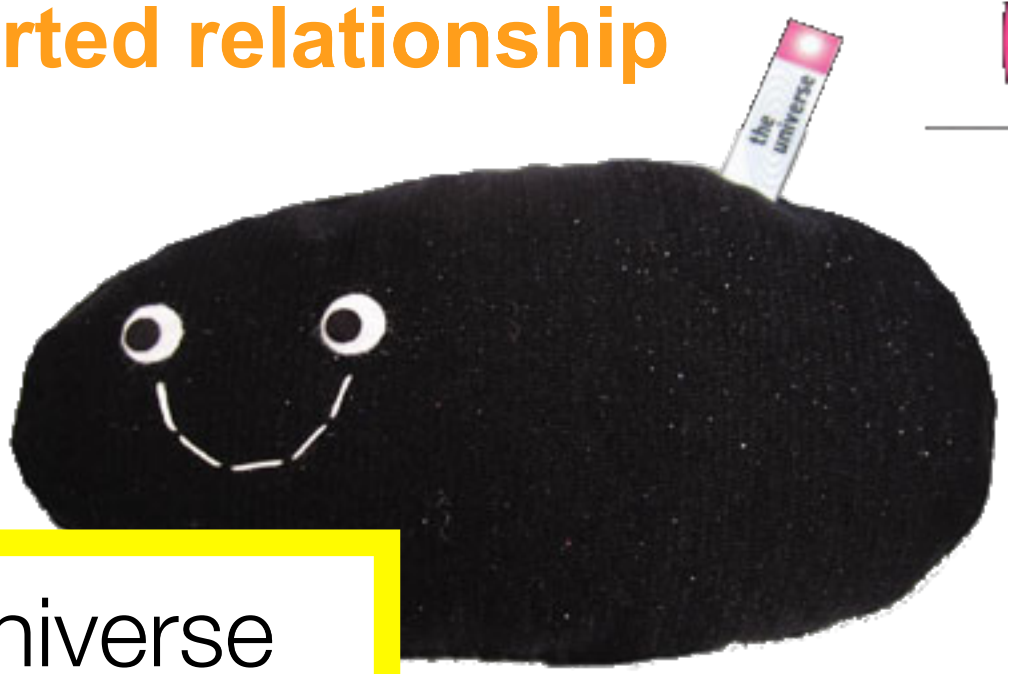
Is the Higgs the portal to the Dark Sector?

- **The Higgs could be first “elementary” scalar we know -**
  - is it really elementary?
  - is it the inflaton?
  - even if not - it is the best “prototype” of a elementary scalar we have

=> study the Higgs properties precisely and look for siblings

The Higgs Boson and the Universe

Exploration of an uncharted relationship



What we'd really like to know

- What is Dark Matter made out of?
- What drove cosmic inflation?
- What generates the mass pattern in quark and lepton sectors?
- What created the matter-antimatter asymmetry?
- What drove electroweak phase transition?
  - and could it play a role in baryogenesis?
- …

Is the Higgs the portal to the Dark Sector?

- **The Higgs could be first "elementary" scalar we know -**
  - is it really elementary?

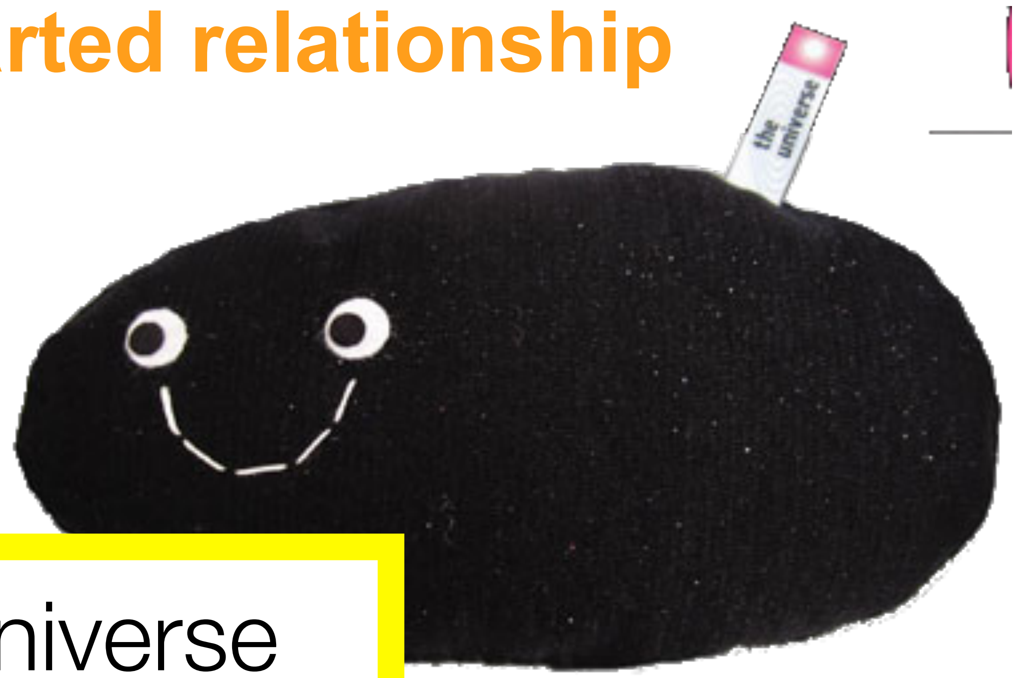
Why is the Higgs-fermion interaction so different between the species?

- does the Higgs generate all the masses of all fermions?
- are the other Higgses involved - or other mass generation mechanisms?
- what is the Higgs' special relation to the top quark, making it so heavy?
- is there a connection to neutrino mass generation?

=> study Higgs and top - and search for possible siblings!

The Higgs Boson and the Universe

Exploration of an uncharted relationship



The Universe

The Higgs Boson

What we'd really like to know

- What is Dark Matter made out of?
- What drove cosmic inflation?
- What generates the mass pattern in quark and lepton sectors?
- What created the matter-antimatter asymmetry?

  - and could it play a role in baryogenesis?
- …

Is the Higgs the portal to the Dark Sector?

- **The Higgs could be first "elementary" scalar we know -**
  - is it really elementary?

Why is the Higgs-fermion interaction so different between the species?

- does the Higgs generate all the masses of all fermions?

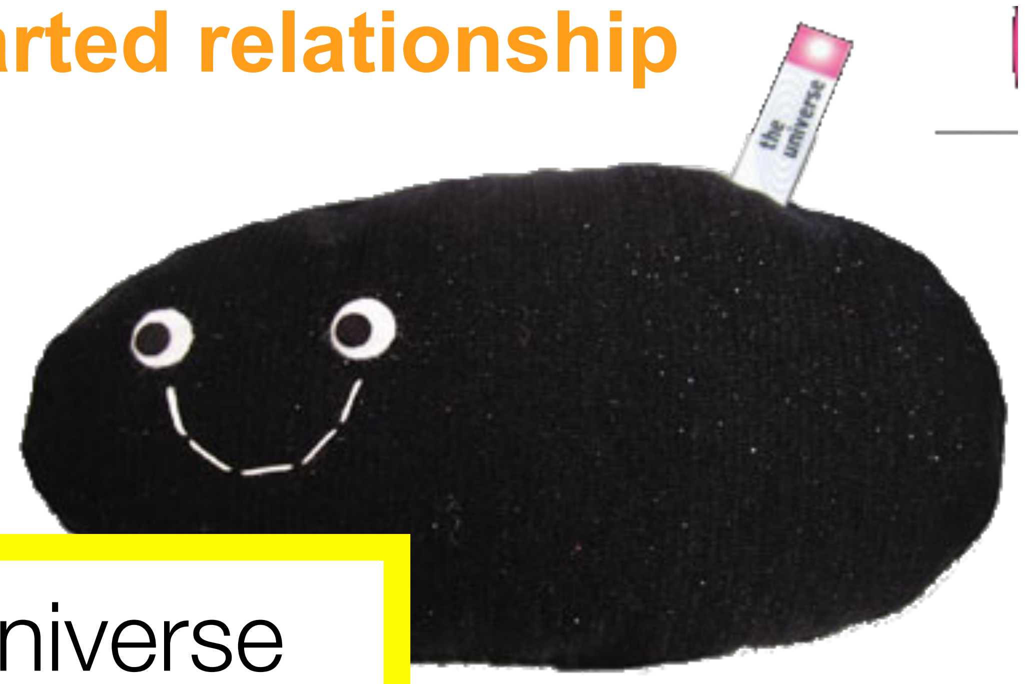
Does the Higgs sector contain additional CP violation?

- in particular in couplings to fermions?
- or do its siblings have non-trivial CP properties?

=> small contributions -> need precise measurements!

The Higgs Boson and the Universe

Exploration of an uncharted relationship



The Universe

The Higgs Boson

What we'd really like to know

- What is Dark Matter made out of?
- What drove cosmic inflation?
- What generates the mass pattern in quark and lepton sectors?
- What created the matter-antimatter asymmetry?
- What drove electroweak phase transition?
  - **and could it play a role in baryogenesis?**
- …

Is the Higgs the portal to the Dark Sector?

- **The Higgs could be first "elementary" scalar we know -**
  - is it really elementary?

Why is the Higgs-fermion interaction so different between the species?

- does the Higgs generate all the masses of all fermions?

Does the Higgs sector contain additional CP violation?

- in particular in couplings to fermions?

What is the shape of the Higgs potential, and its evolution?

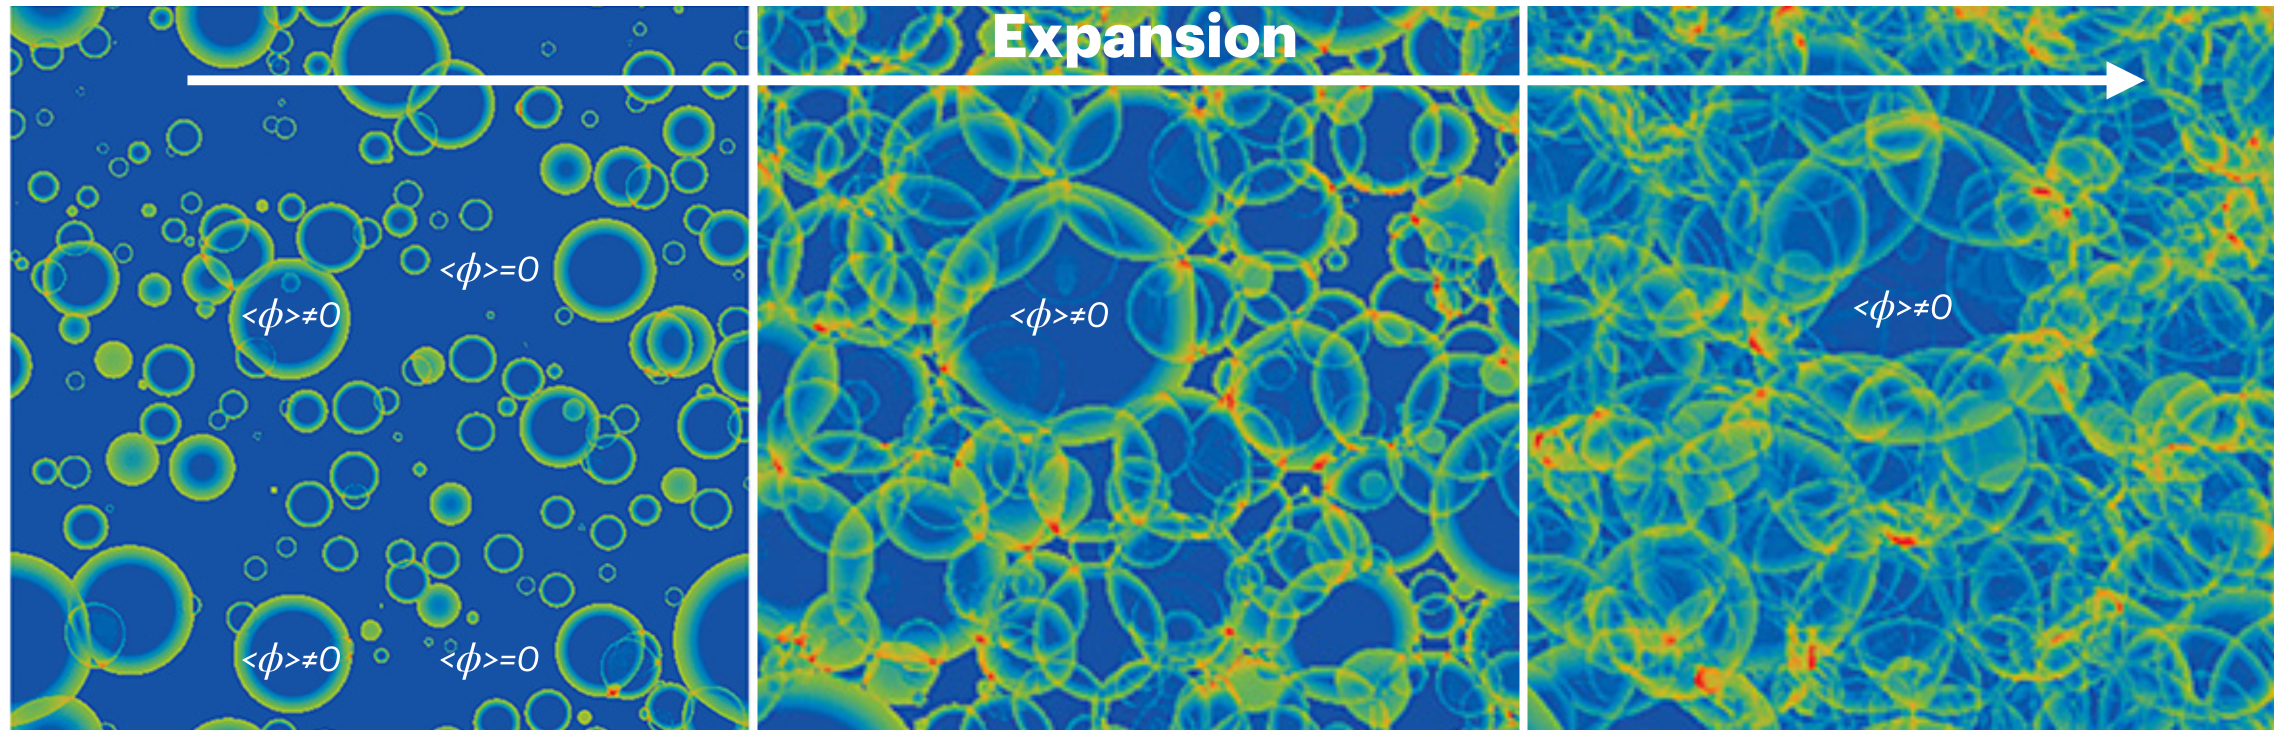
- do Higgs bosons self-interact?
- at which strength? => 1st or 2nd order phase transition?

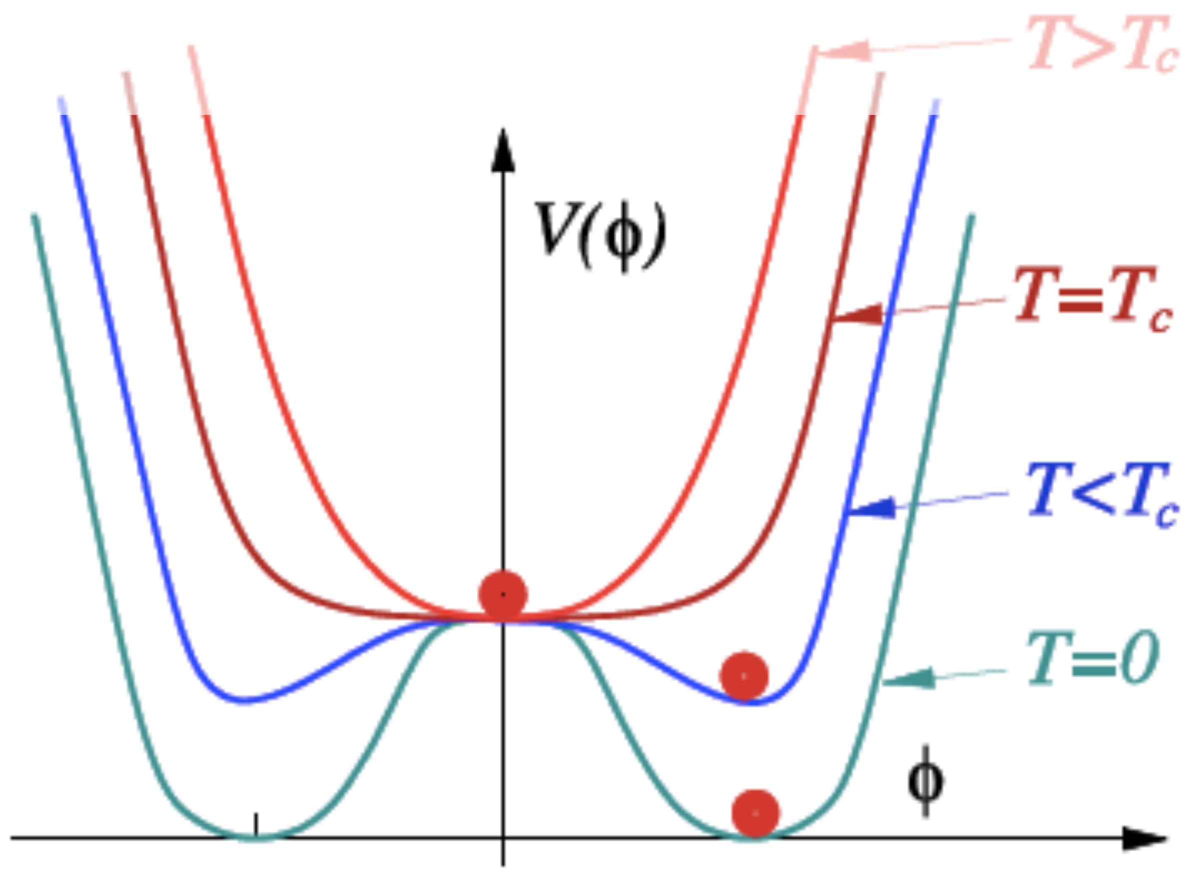
=> discover and study di-Higgs production

The Higgs potential, the Higgs self-coupling and Baryogenesis

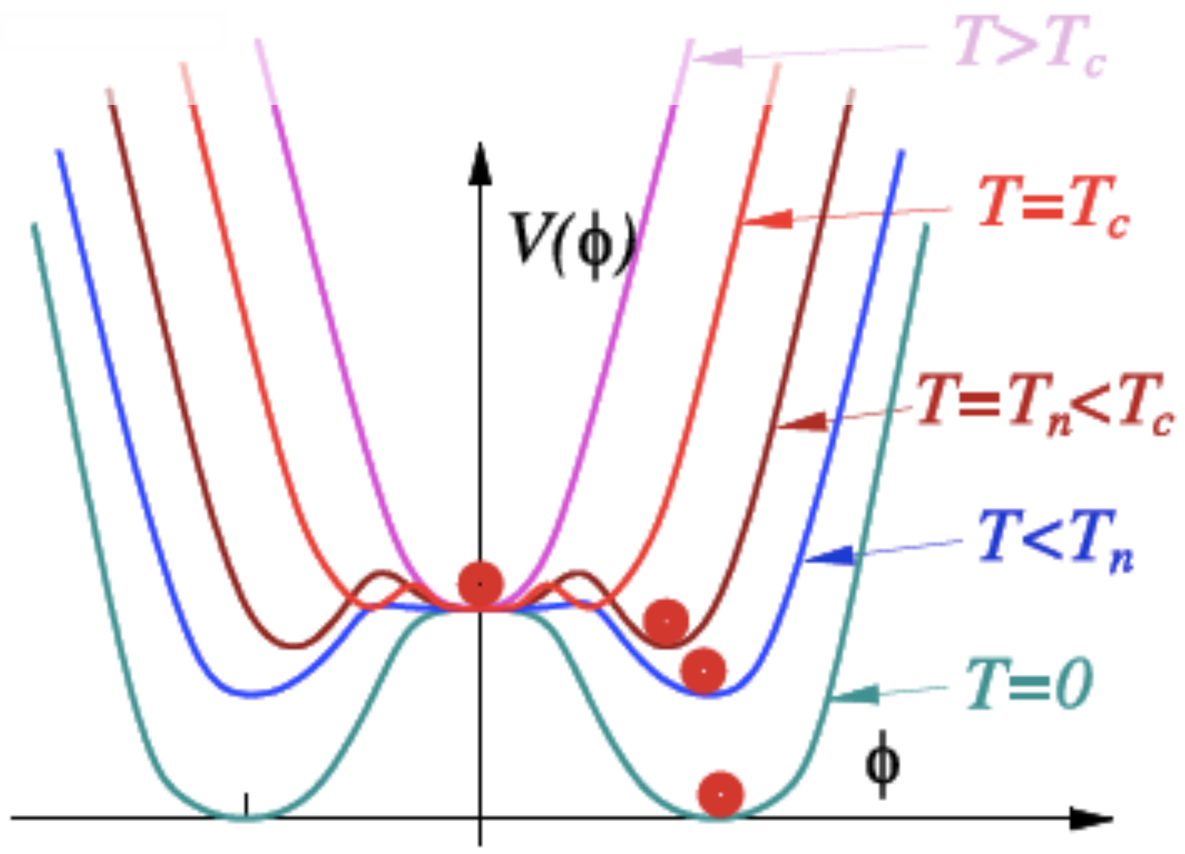
1st vs 2nd order phase transition

- origin of matter-antimatter asymmetry: universe must have been out of thermal equilibrium => 1.order phase transition
- **Electroweak phase transition?**





2nd order

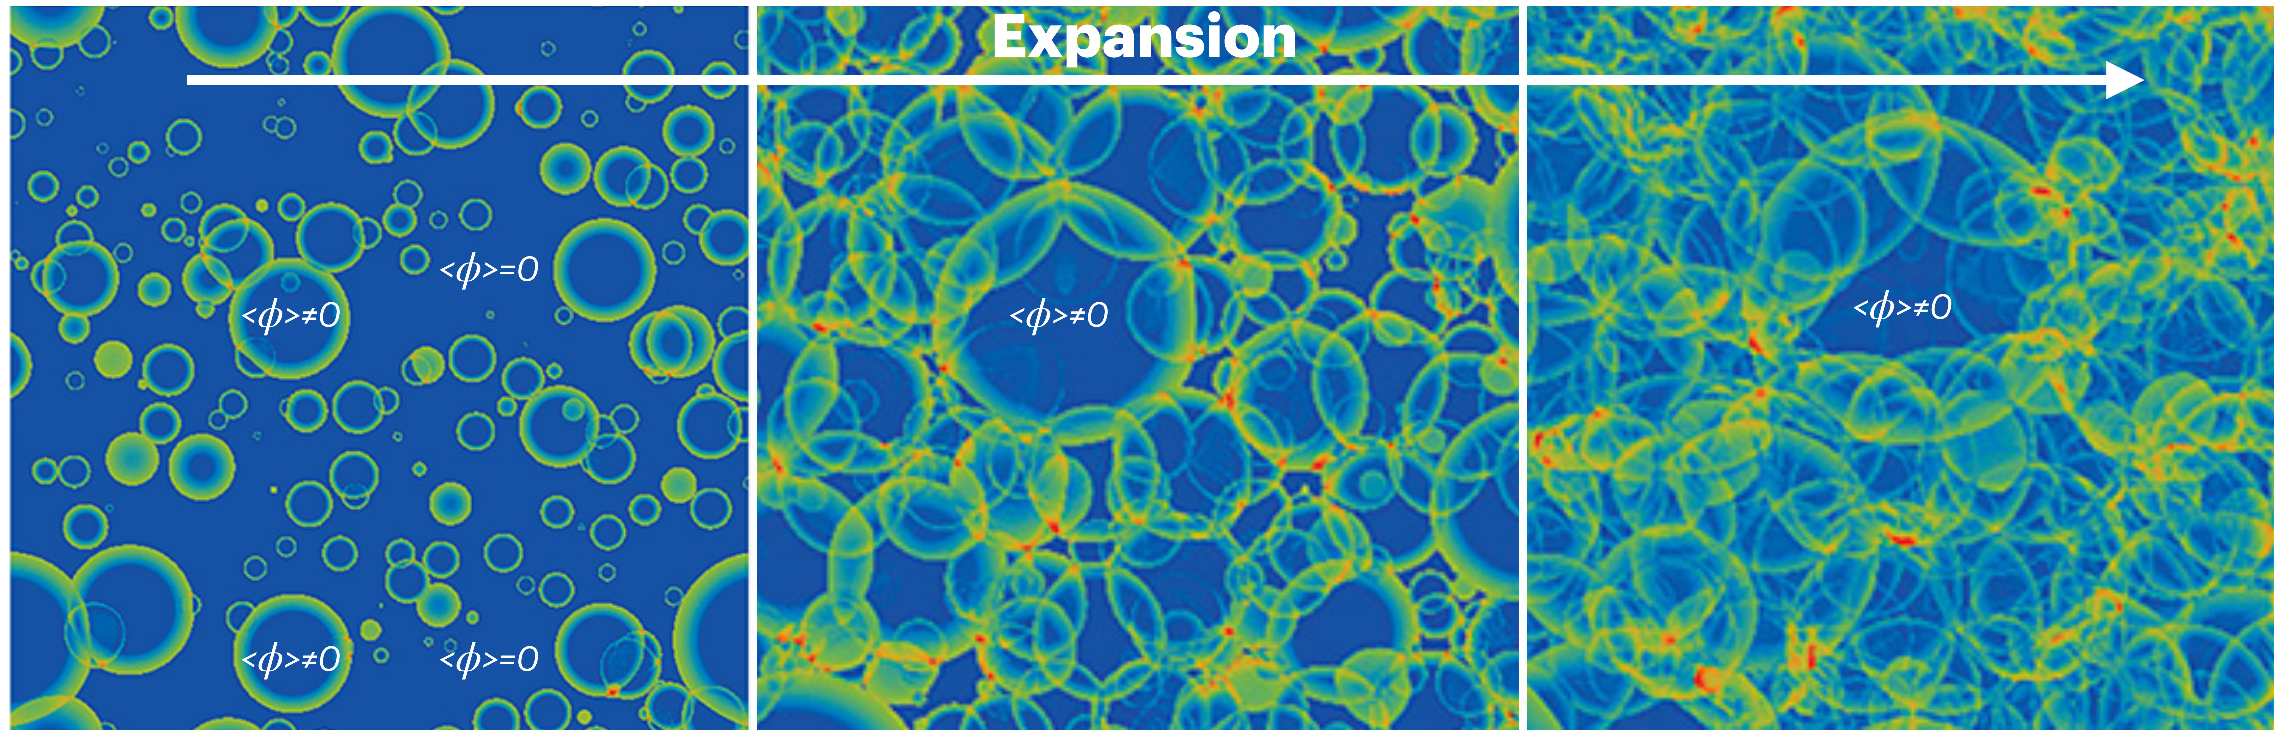


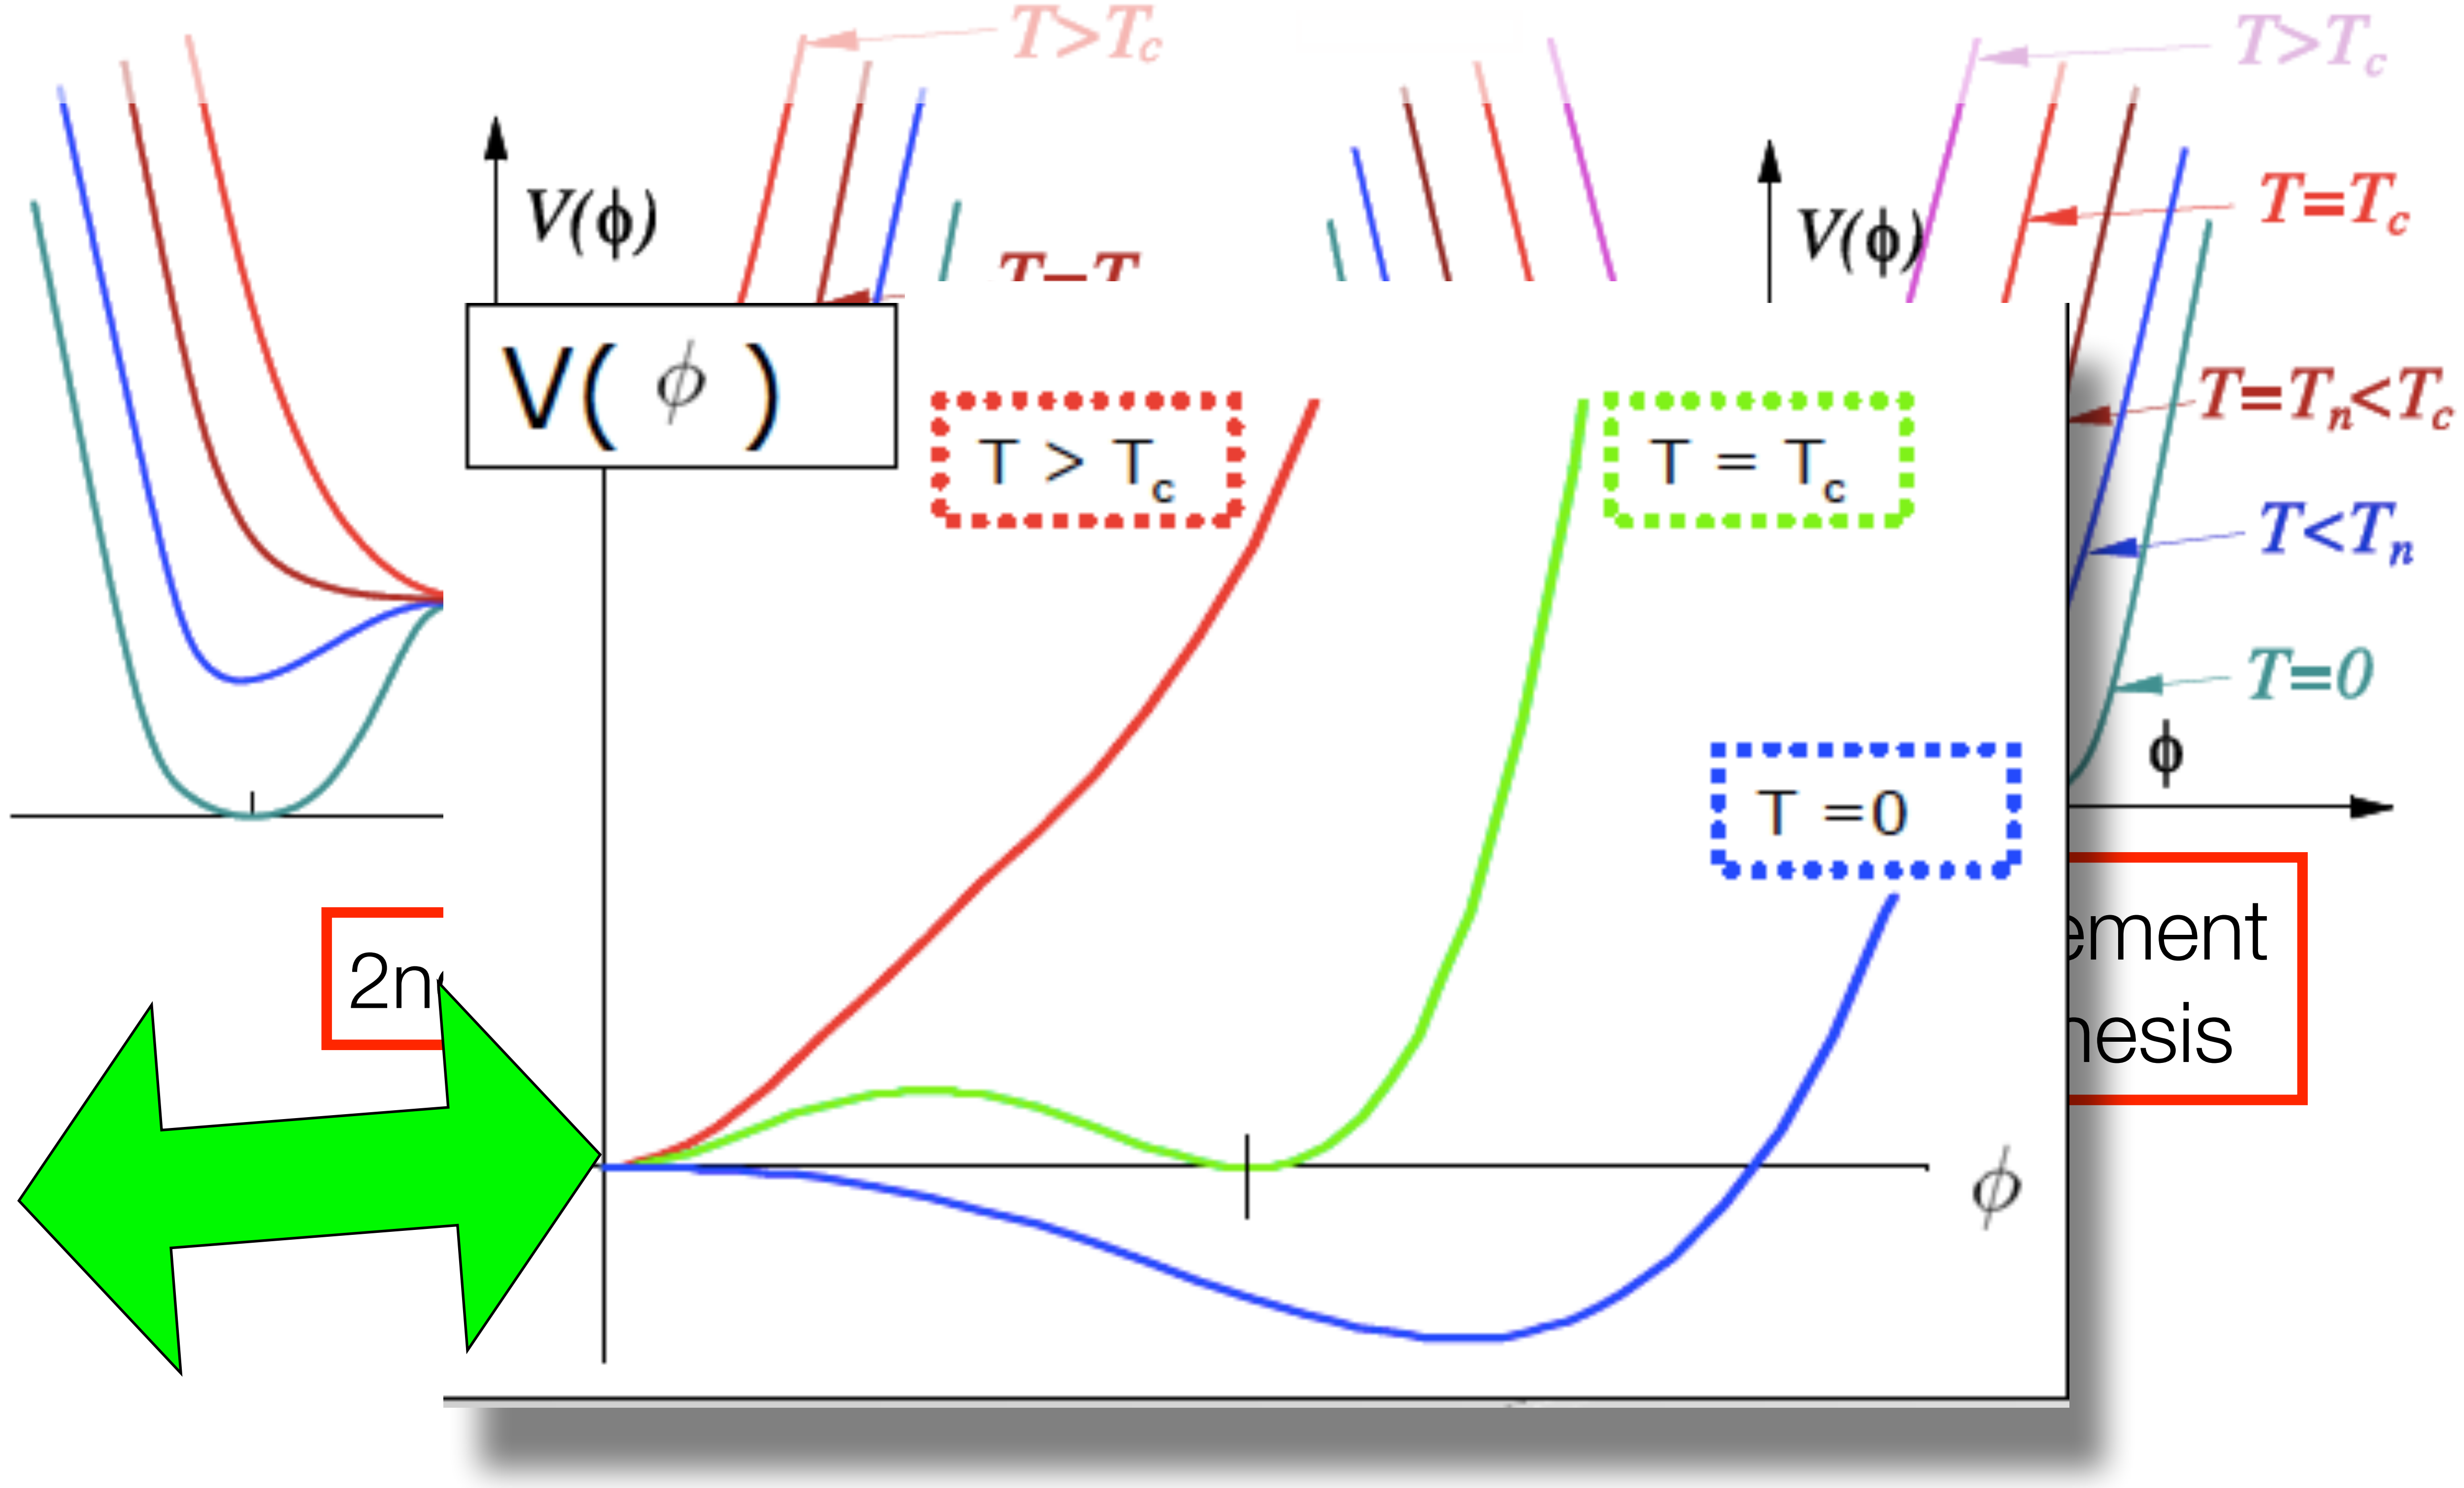
1st order, requirement for EW baryogenesis

The Higgs potential, the Higgs self-coupling and Baryogenesis

1st vs 2nd order phase transition

- origin of matter-antimatter asymmetry: universe must have been out of thermal equilibrium => 1.order phase transition
- **Electroweak phase transition?**





The Higgs potential, the Higgs self-coupling and Baryogenesis

- value of self-coupling λ determines shape of Higgs potential
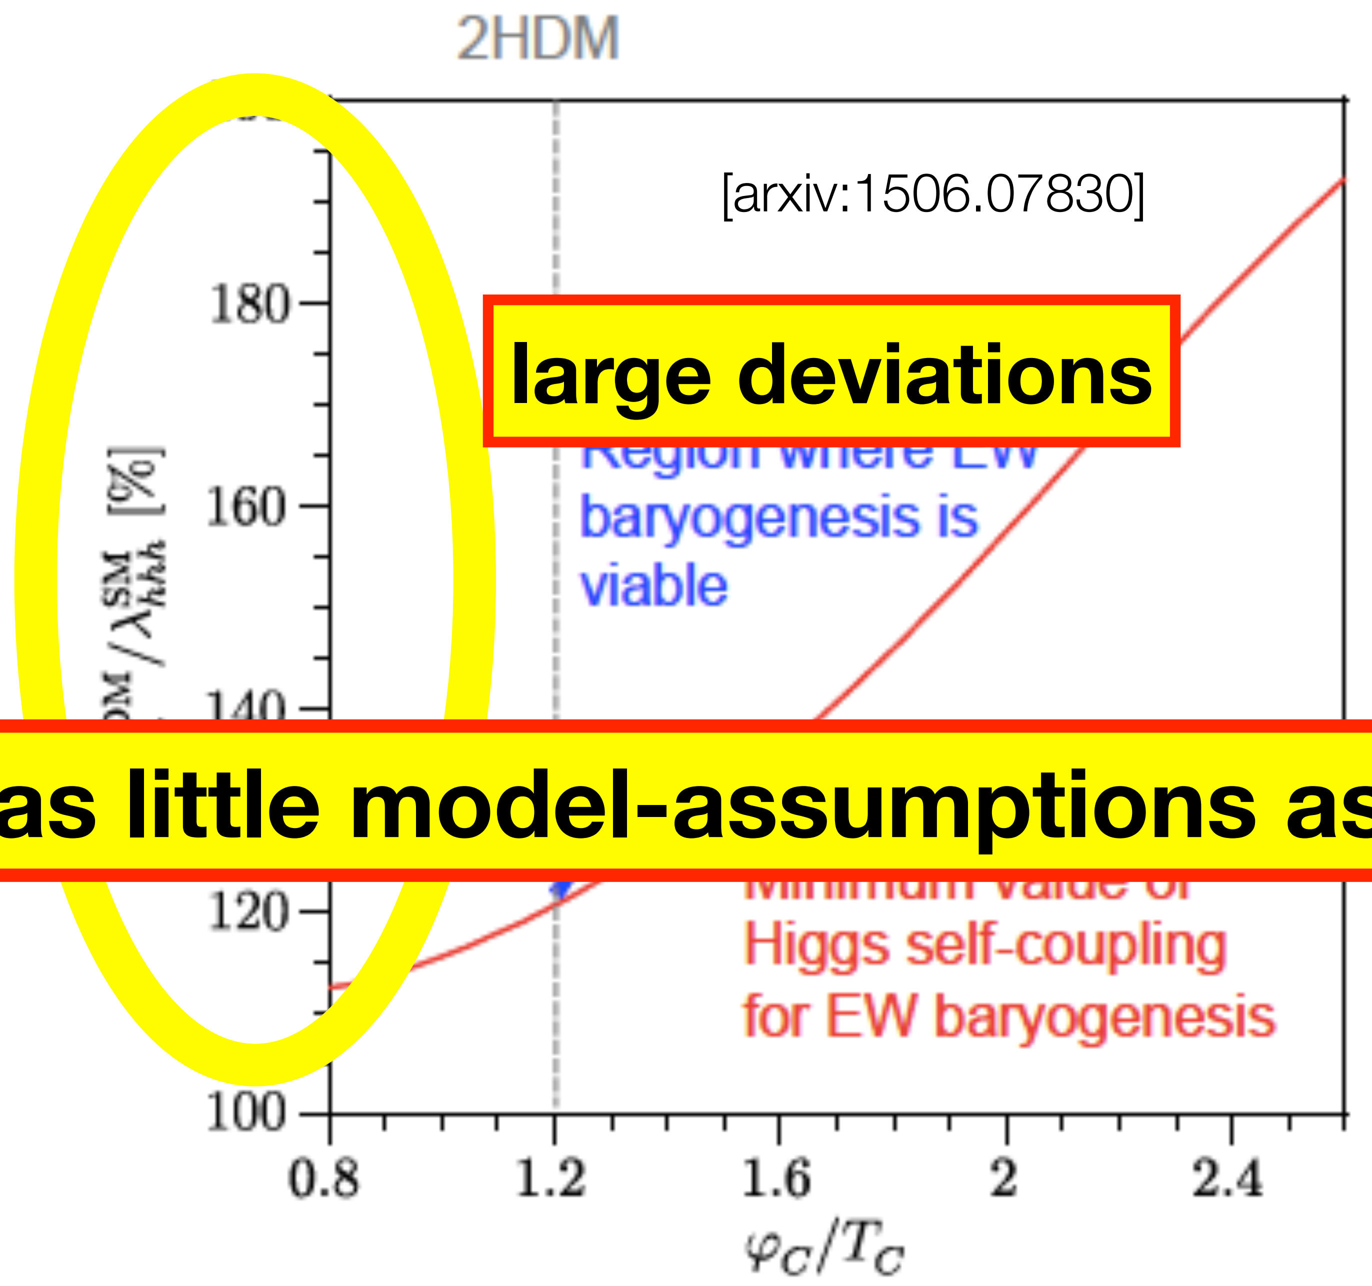
- electroweak baryogenesis possible in BSM scenarios with $\lambda > \lambda_{SM}$ (e.g. 2HDM, NMSSM, …)



=> measure λ, with as little model-assumptions as possible!

The Higgs Boson Mission

Why we need a Higgs Factory

- **Find out as much as we can about the 125-GeV Higgs**
  - Basic properties:
    - **total production rate**, total width
    - decay rates to known particles
    - **invisible decays**
    - search for "exotic decays"
  - CP properties of couplings to gauge bosons and fermions
  - **self-coupling**
  - Is it the only one of its kind, or are there **other Higgs (or scalar) bosons**?
- **To interprete these Higgs measurements, also need**
  - top quark: mass, Yukawa & electroweak couplings, their CP properties…
  - Z / W bosons: masses, couplings to fermions, triple gauge couplings, incl CP…
- **Search for direct production of new particles - and determine their properties**
  - Dark Matter? **Dark Sector?**
  - Heavy neutrinos?
  - SUSY? **Higgsinos?**
  - The **UNEXPECTED** !

The Higgs Boson Mission

Why we need a Higgs Factory

  - SUSY? **Higgsinos?**
  - The **UNEXPECTED** !

=> e+e- Higgs factory identified as the highest priority next collider by

- European Strategy for Particle Physics (2020)
- The Snowmass process in the US (2022)

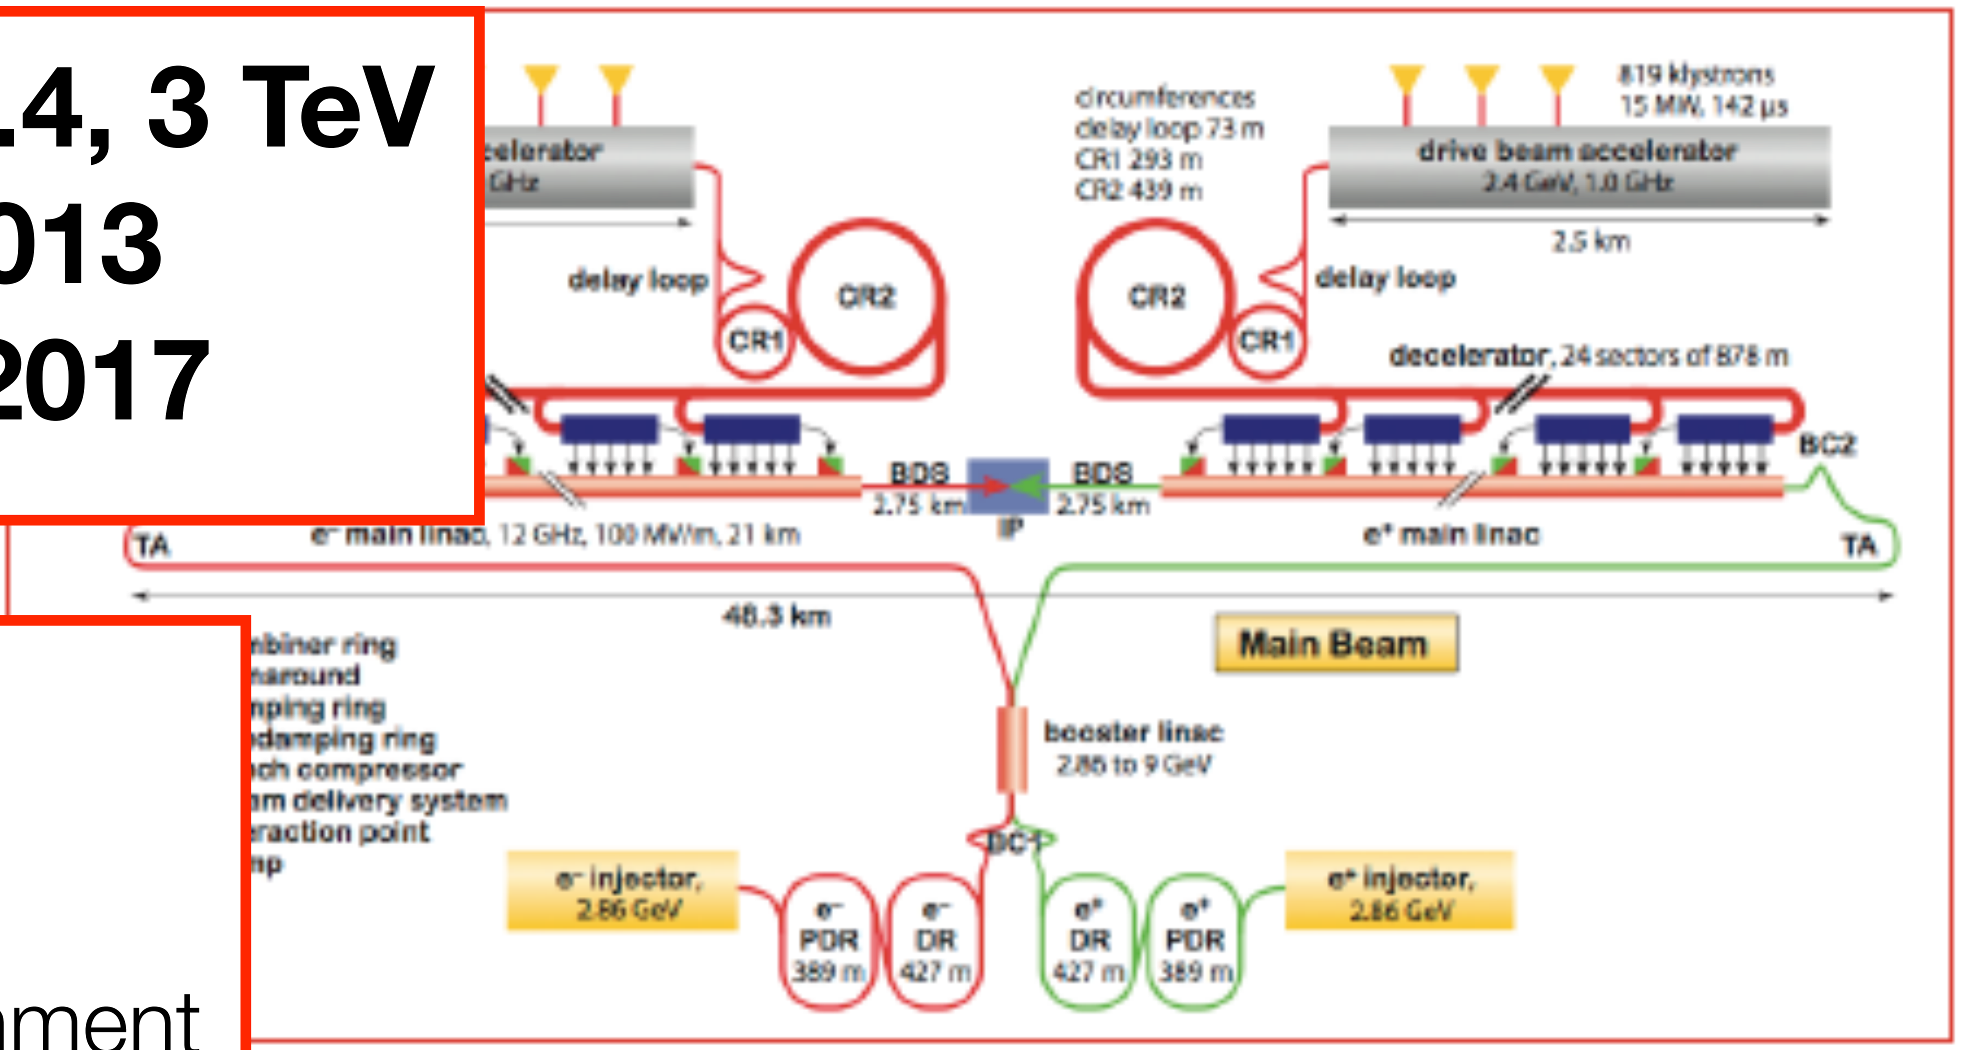
Conditions at e+e- colliders very complementary to LHC:

- in particular low backgrounds
- clean events
- triggerless operation

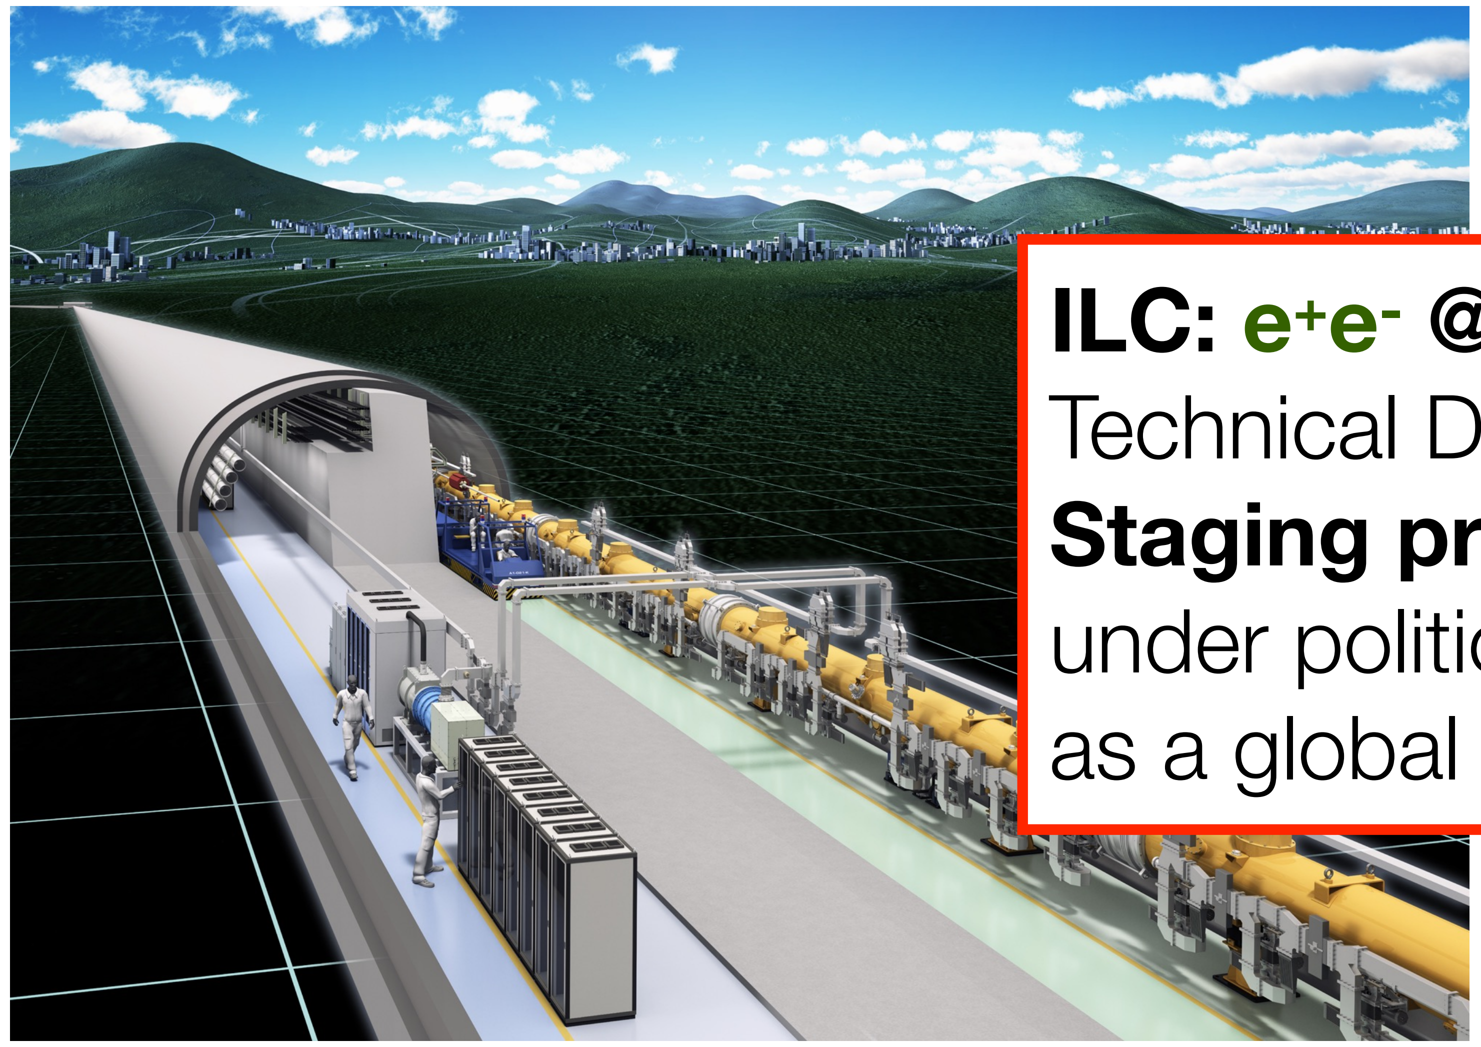
The key contenders

many ideas…

CLIC: e+e- @ 0.38, 1.4, 3 TeV
Conceptual Design **2013**
Updated Baseline in **2017**

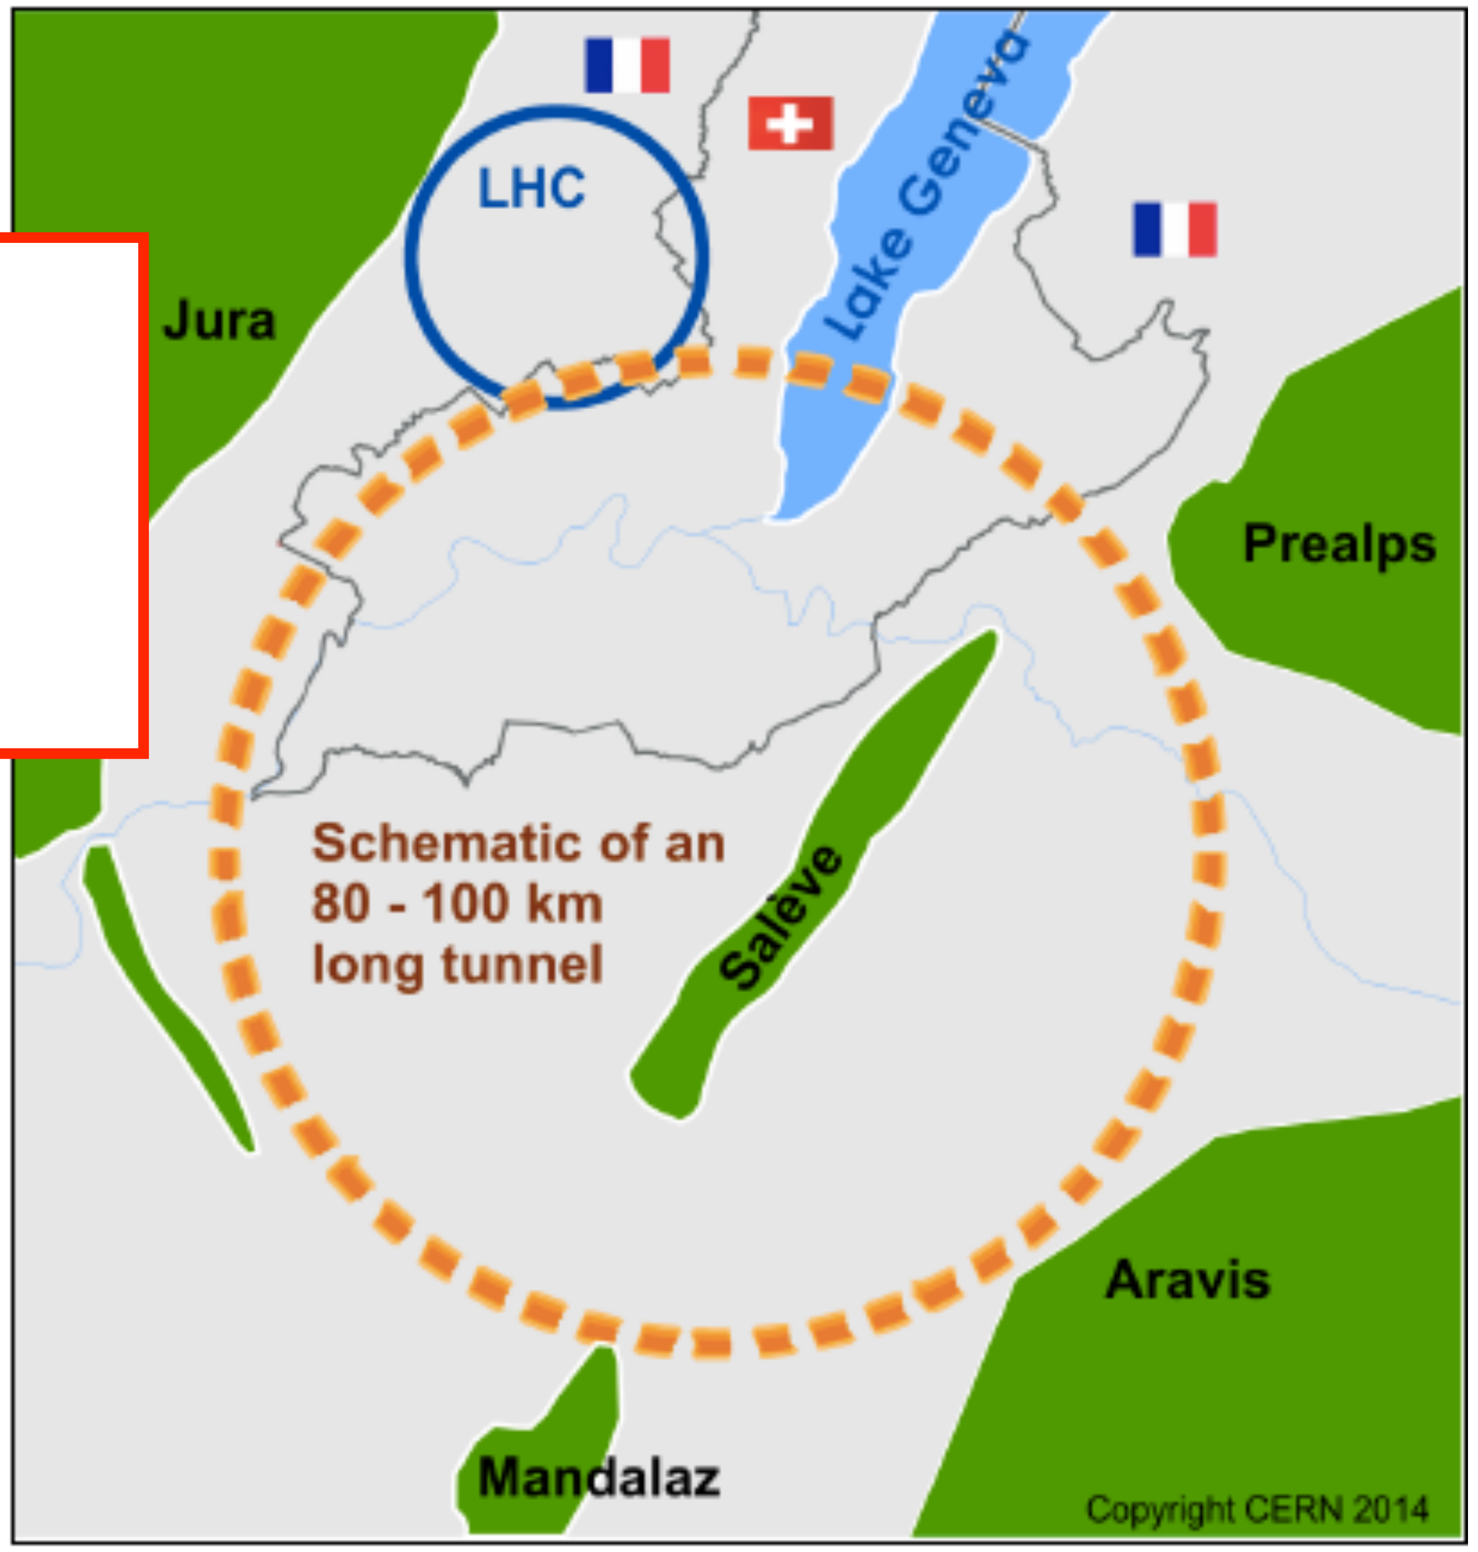


ILC: e+e- @ 200-500 GeV (-1TeV)
Technical Design Rep. in **2012**
Staging proposal 2017: start at 250 GeV
under political consideration by Japanese Government as a global project



FCC: pp @ ~100 TeV
& precursor **FCCee e+e- @ 90-350 GeV**
Conceptual Design Rep. in **2018**

Currently: FCC Feasibility Study



CEPC: e+e- @ 240 GeV
pre-CDR published in **2014**
CDR published **2018**

SppC: pp @ 50-70 TeV

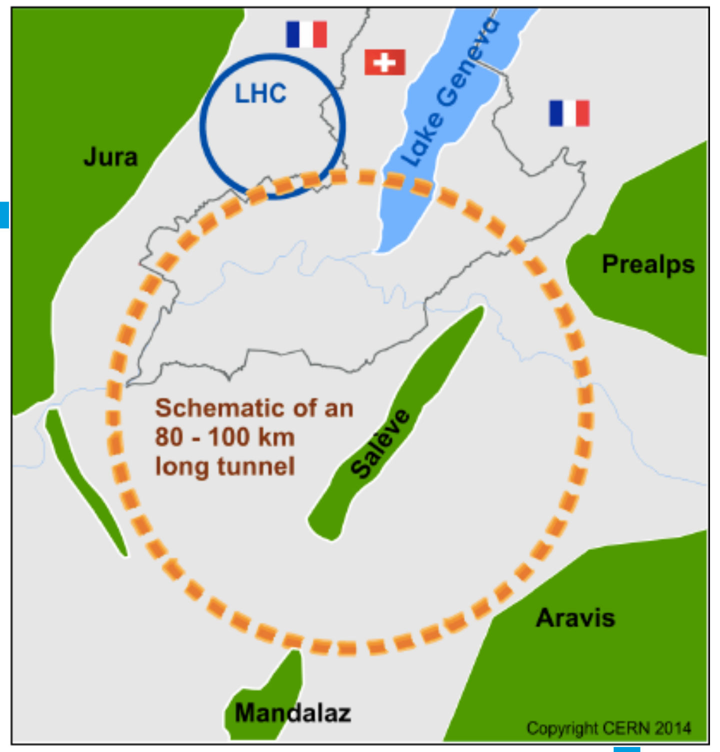
And many very recent ideas from the US

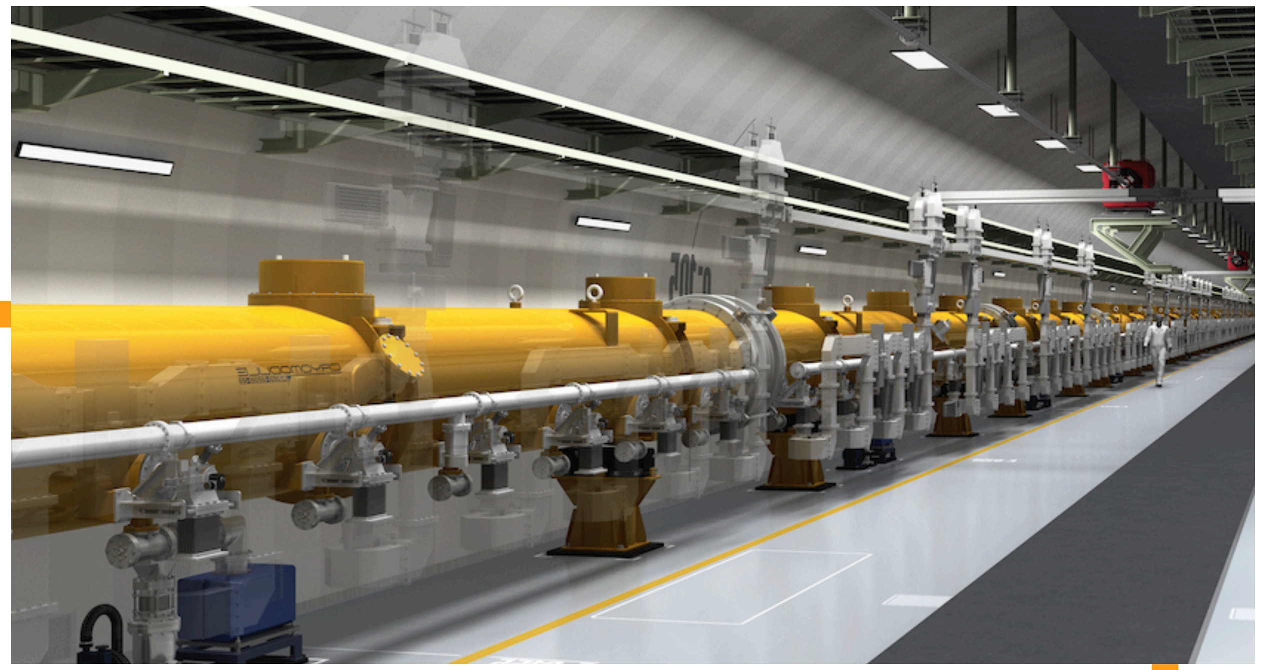
They fall into two classes

Each have their advantages



Circular e+e- Colliders

- FCCee, CEPC
- length 250 GeV: ~100km
- high luminosity & power efficiency at **low energies**
- **multiple interaction regions**
- very clean: little beamstrahlung etc



Linear Colliders

- **ILC**, CLIC
- length 250 GeV: ~10…20 km
- high luminosity & power efficiency at **high energies**
- **spin-polarised beam(s)**

Long-term vision: re-use of tunnel for pp collider

- technical and financial feasibility of required magnets still unclear

Long-term upgrades: energy extendability

- same technology: by increasing length
- **or by replacing accelerating structures with advanced technologies**
  - RF cavities with high gradient
  - plasma ?

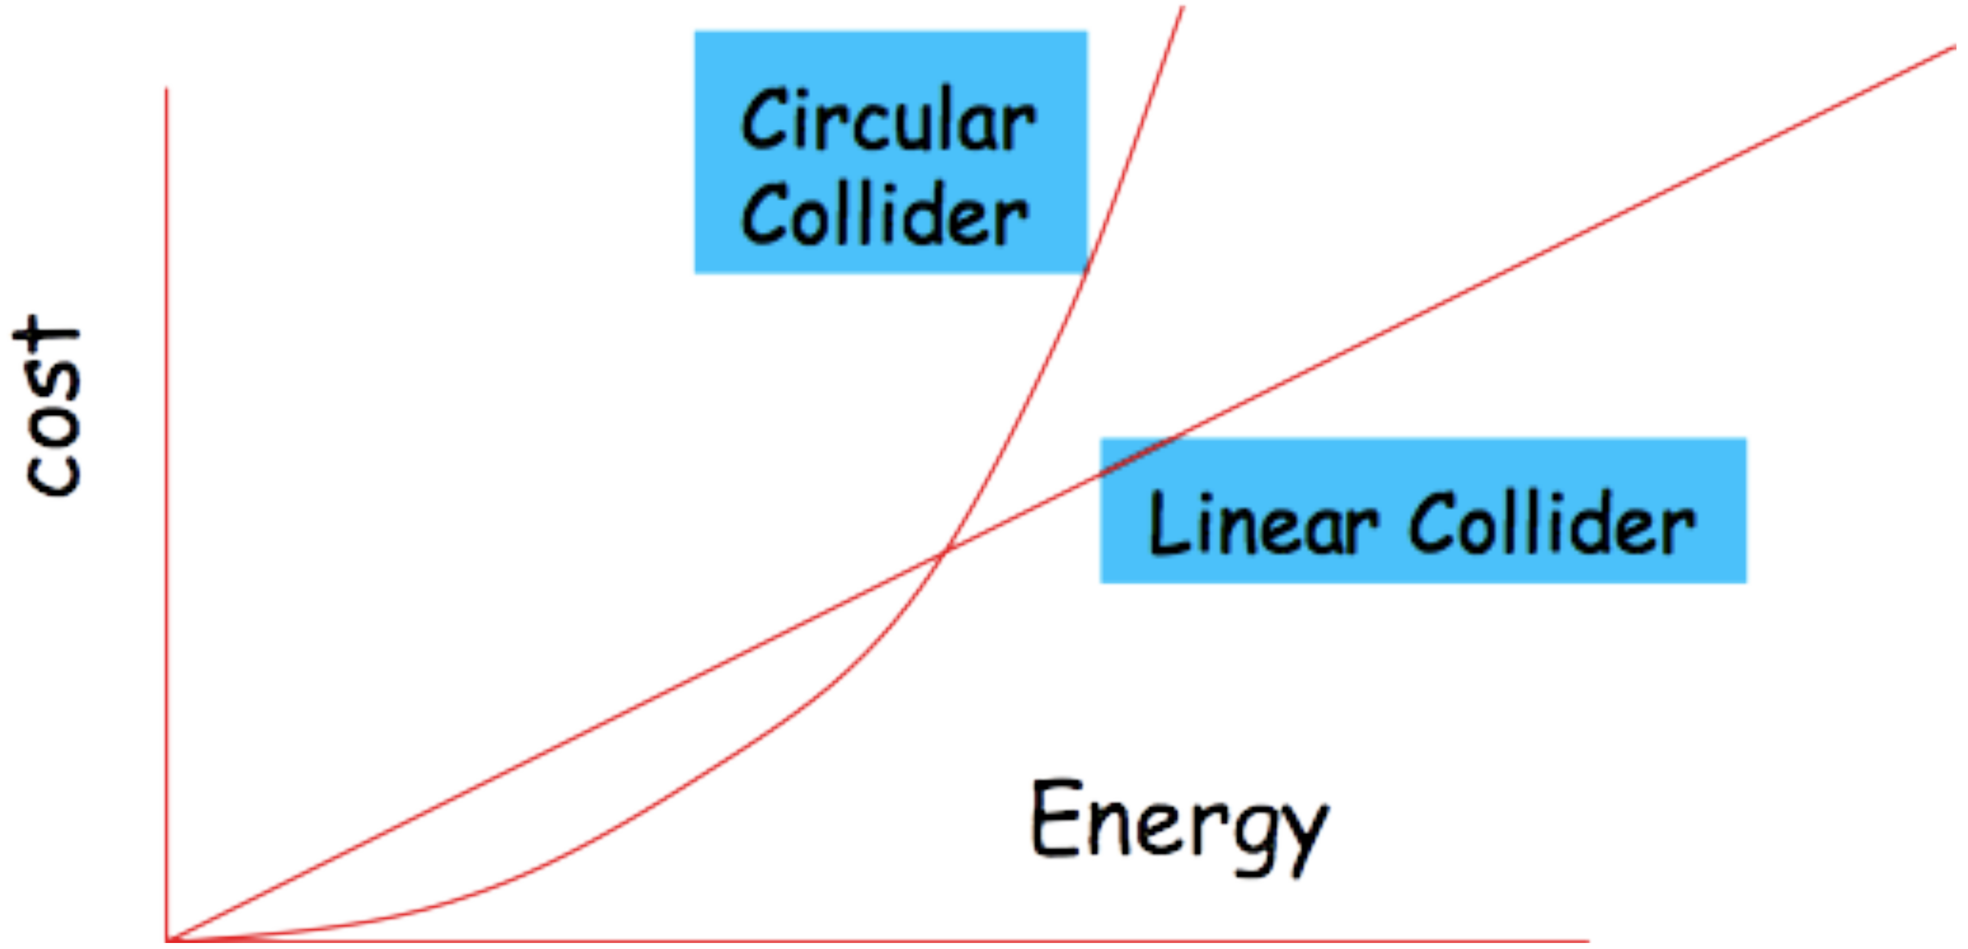
Linear or circular - economically

1978[1)]

accelerated charges radiate….

- **Synchrotron radiation:**
  - **$\Delta E \sim (E^4 / m^4 R)$** per turn => 2 GeV at LEP2
- **Cost in high=energy limit:**
  - **circular :** $\$\$ \sim a R + b \Delta E \sim a R + b (E^4 / m^4 R)$

    optimize => $R \sim E^2$ => **$\$\$ \sim E^2$**
  - **linear :** $\$\$ \sim L$, with **$L \sim E$** => **$\$\$ \sim E$**



LIMITATIONS ON PERFORMANCE OF e^+e^- STORAGE RINGS AND

LINEAR COLLIDING BEAM SYSTEMS AT HIGH ENERGY

J.-E. Augustin*, N. Dikanski†, Ya. Derbenev†, J. Rees‡,
B. Richter‡, A. Skrinski†, M. Tigner**, and H. Wiedemann‡

Introduction

This note is the report of working Group I (J. Rees - Group Leader). We were assisted at times by U. Amaldi and E. Keil of CERN. We concerned ourselves primarily with the technical limitations which might present themselves to those planning a new and higher-energy electron-positron colliding-beam facility in a future era in which, it was presumed, a 70-GeV to 100-GeV LEP-like facility would already exist. In such an era, we reasoned, designers would be striving for center-of-mass energies of at least 700-GeV to 1-TeV. Two different approaches to this goal immediately came to the fore: one, a storage ring based on the principles of PEP, PETRA, and LEP and the other, a system in which a pair of linear accelerators are aimed at one another so that their beams will collide. We realized early in the study that a phenomenon which has been negligible in electron-positron systems designed to date would become important at these higher energies - synchrotron radiation from a particle being deflected by the collective electromagnetic field of the opposing bunch - and we dubbed this phenomenon "beam-strahlung." During the rest of the week we investigated the scaling laws for these two colliding-beam systems taking beam-strahlung into consideration.

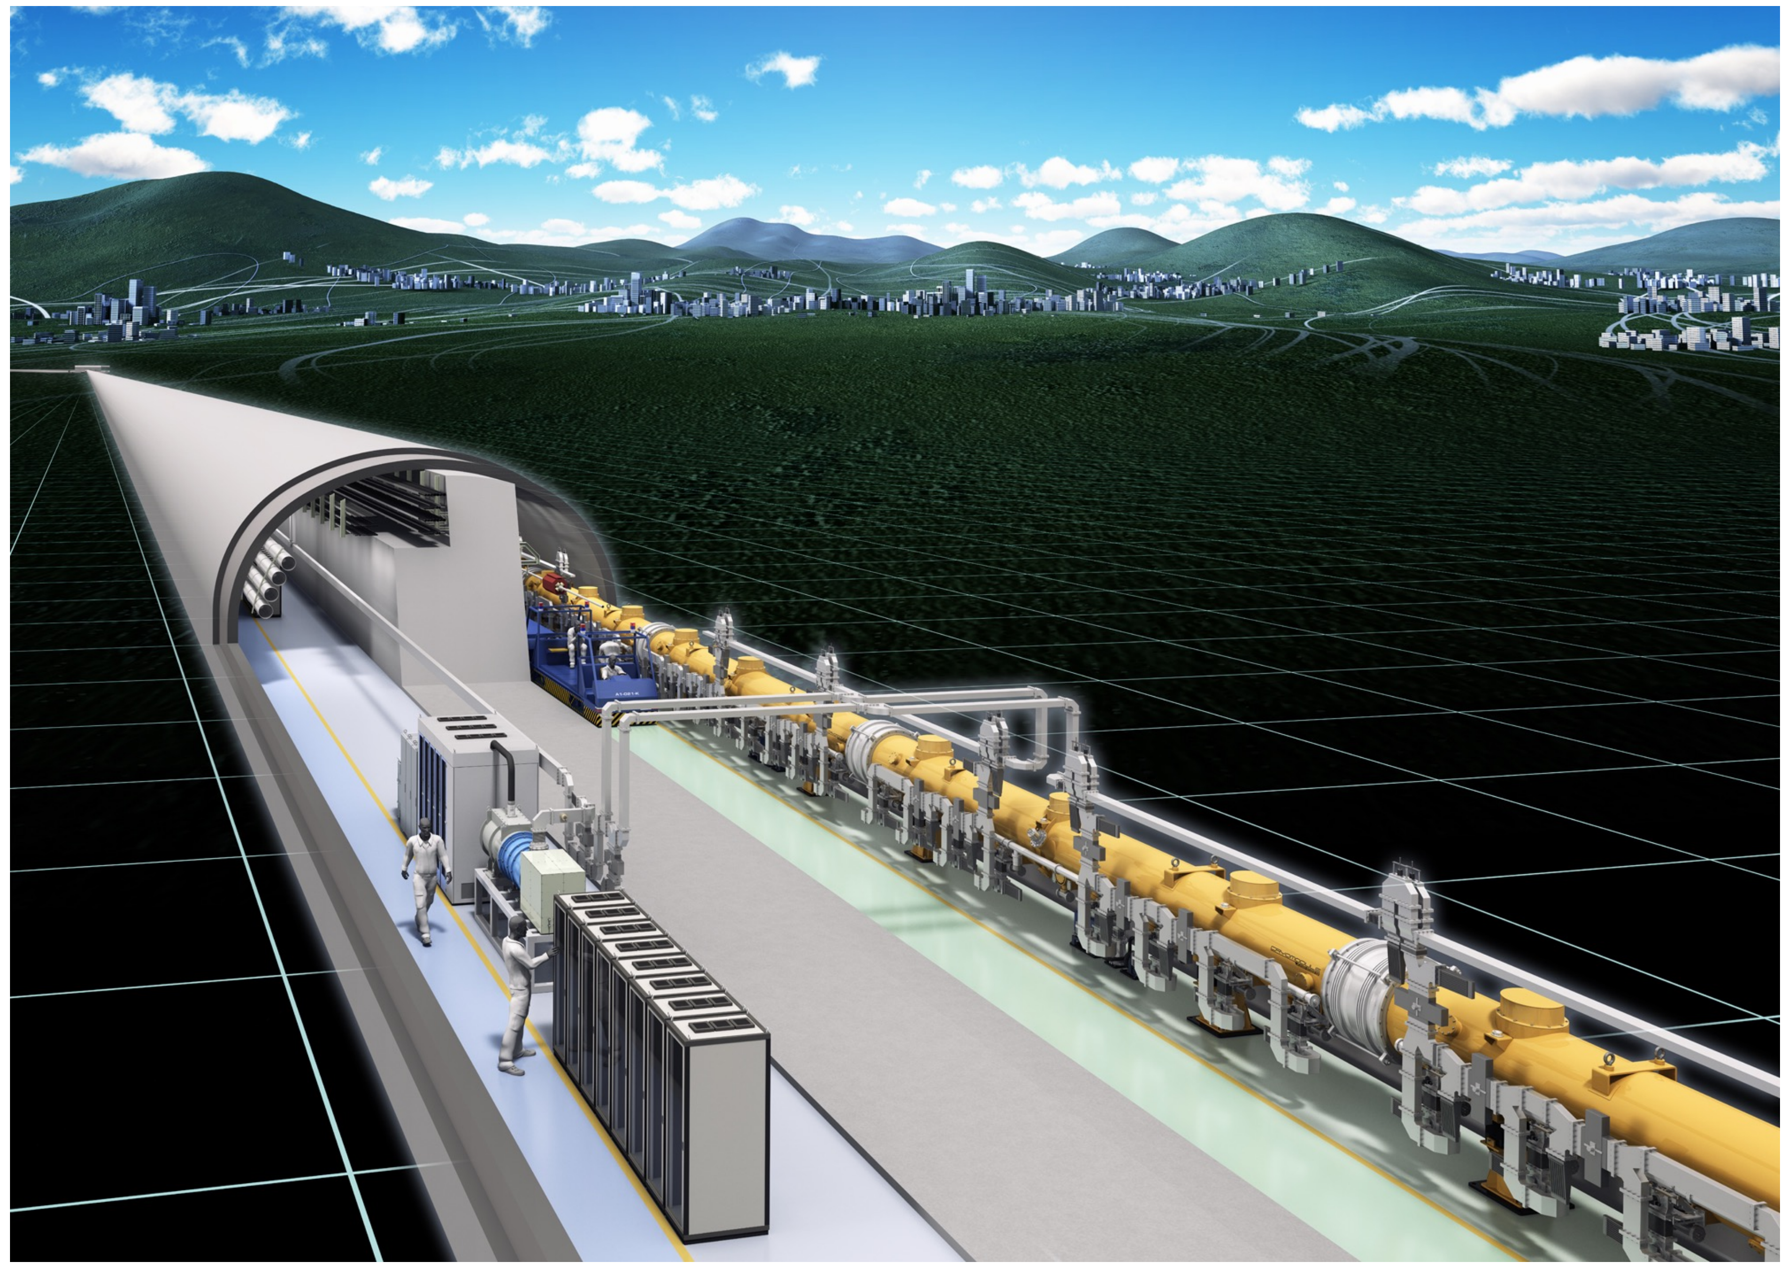
ILC Political Status

The International Development Team (IDT)

- **ILC project run by the International Development Team (IDT) mandated by ICFA**
- 2020: The IDT – created by ICFA and hosted by KEK – prepared the ILC Preparation Phase plan ("Pre-lab"), which would over a ~4 year period, lead to a complete Engineering Design as needed to start construction of the ILC.
- Late 2020 - early 2021: The plan was reviewed by a MEXT appointed panel and deemed premature, referring to that the prospects for an international cost sharing for ILC were not clear. However increased support for technical developments and accelerator R&D was recommended.
- During 2021- early 2022: Within the IDT a subset of the technical activities of the full preparation phase programme has been identified as priorities, to be addressed with an international effort. The required resources are at ~1/3 level of the original plans. The activities planned are foreseen to take 2-4 years.
- second half of 2022: These plans were included MEXT budget request and has been approved by the Finance Ministry. The funding can become available in May 2023 (DIET approval needed). It will double the KEK resourced available for ILC preparation, and in particular provides important new funding for ILC relevant hardware developments. Some parts of this funding can be used to foster international collaboration and efforts. The budget needs to be approved yearly, but the programme is set up for five years.
- We call this pre-preparation program the **ILC Technology Network (ITN)**
  Start: ~NOW!
  - **resources in ITN mainly for accelerator work**
  - **IDT-WG3 continues to foster physics & detector R&D**
  - **preparation for detector proposals at the end of ITN needs to start now in parallel with accelerator preparations**



Sustainability - in the ILC's DNA since a long time

2016 …..

Additional Design Considerations

- **power consumption:**
  - public acceptance for large scale projects significantly challenged if (substantial fractions of) extra power plant required!
  - **ILC design driven by *self-imposed* limits on total site power:**
    - **200 MW for 500 GeV**
    - **300 MW for 1 TeV**

✗

✔

- **cost awareness:**
  - from RDR to TDR critical review of design in order to reduce costs
  - value engineering
  - power reduction in favour of stronger focussing

- **at the end of the day: luminosity ~ power ~ money**

Sustainability - in the ILC's DNA since a long time

2016 …..

Additional Design Considerations

- **power consumption:**
  - public acceptance for large scale projects significantly challenged if (substantial fractions of) extra power plant required!
  - **ILC design driven by *self-imposed* limits on total site power:**

    - **200 MW for 500 GeV**
    - **300 M**
- **cost awarene**
  - from RDR of design i
  - value engineering
  - power reduction in favour of stronger focussing

- **at the end of the day: luminosity ~ power ~ money**

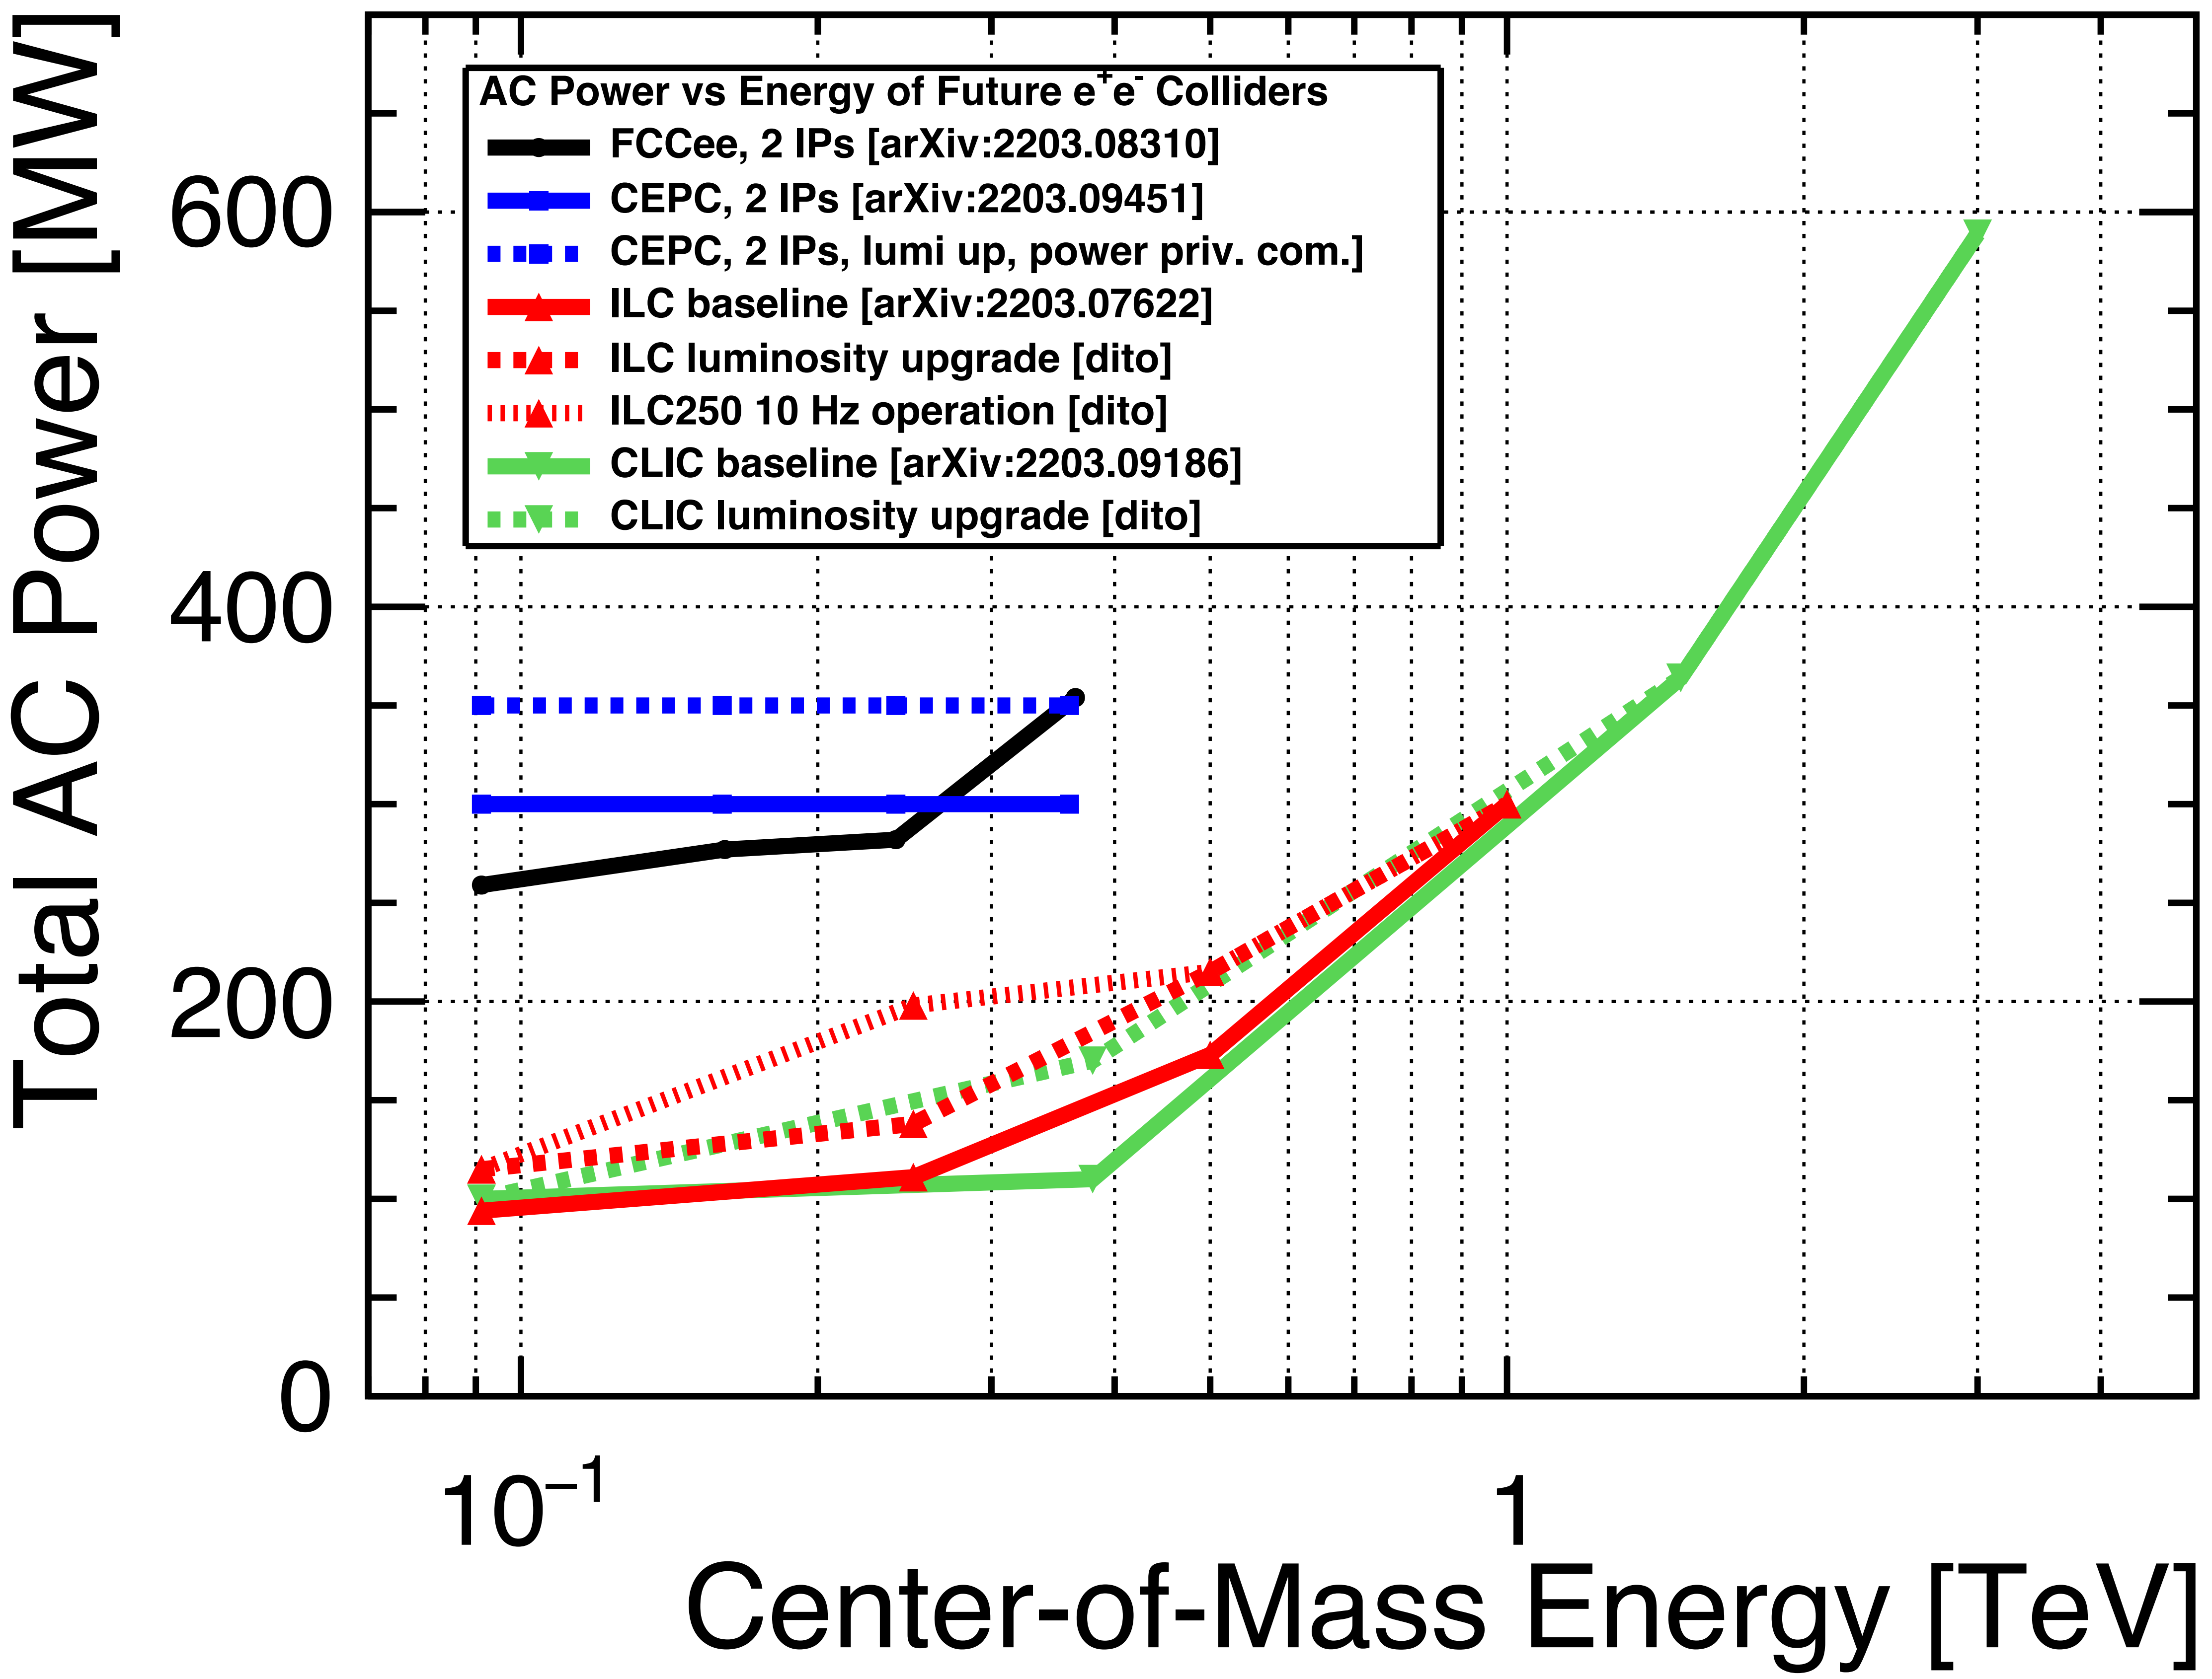
- **minimal usage of resources was always design criterion for serious projects**
- **but only a reduction of the energy consumption is not sufficient anymore**
- **change of paradigm:**
  => the next collider project must be sustainable in every aspect

… and tomorrow: Sustainability of new Accelerators

Much more than CO2 equivalents…

minimal use of resources to reach physics goals

- Operation -> **total electrical site power**:
  - **minimize**:
    - even if - or especially if - all power will come from regenerative sources, the competition with other human needs will be high
    - optimizing all components for minimal energy consumtion
  - **be flexible**:
    - must be able to handle large variations in availability of regenerative power
    - could cooling capacities be used as buffer for energy, also for society in general?
- Constuction, concrete etc
  - **tunnel as short as possible**
  - use concrete with low(er) CO2 emission
  - avoid usage of rare earths and other problematic substances

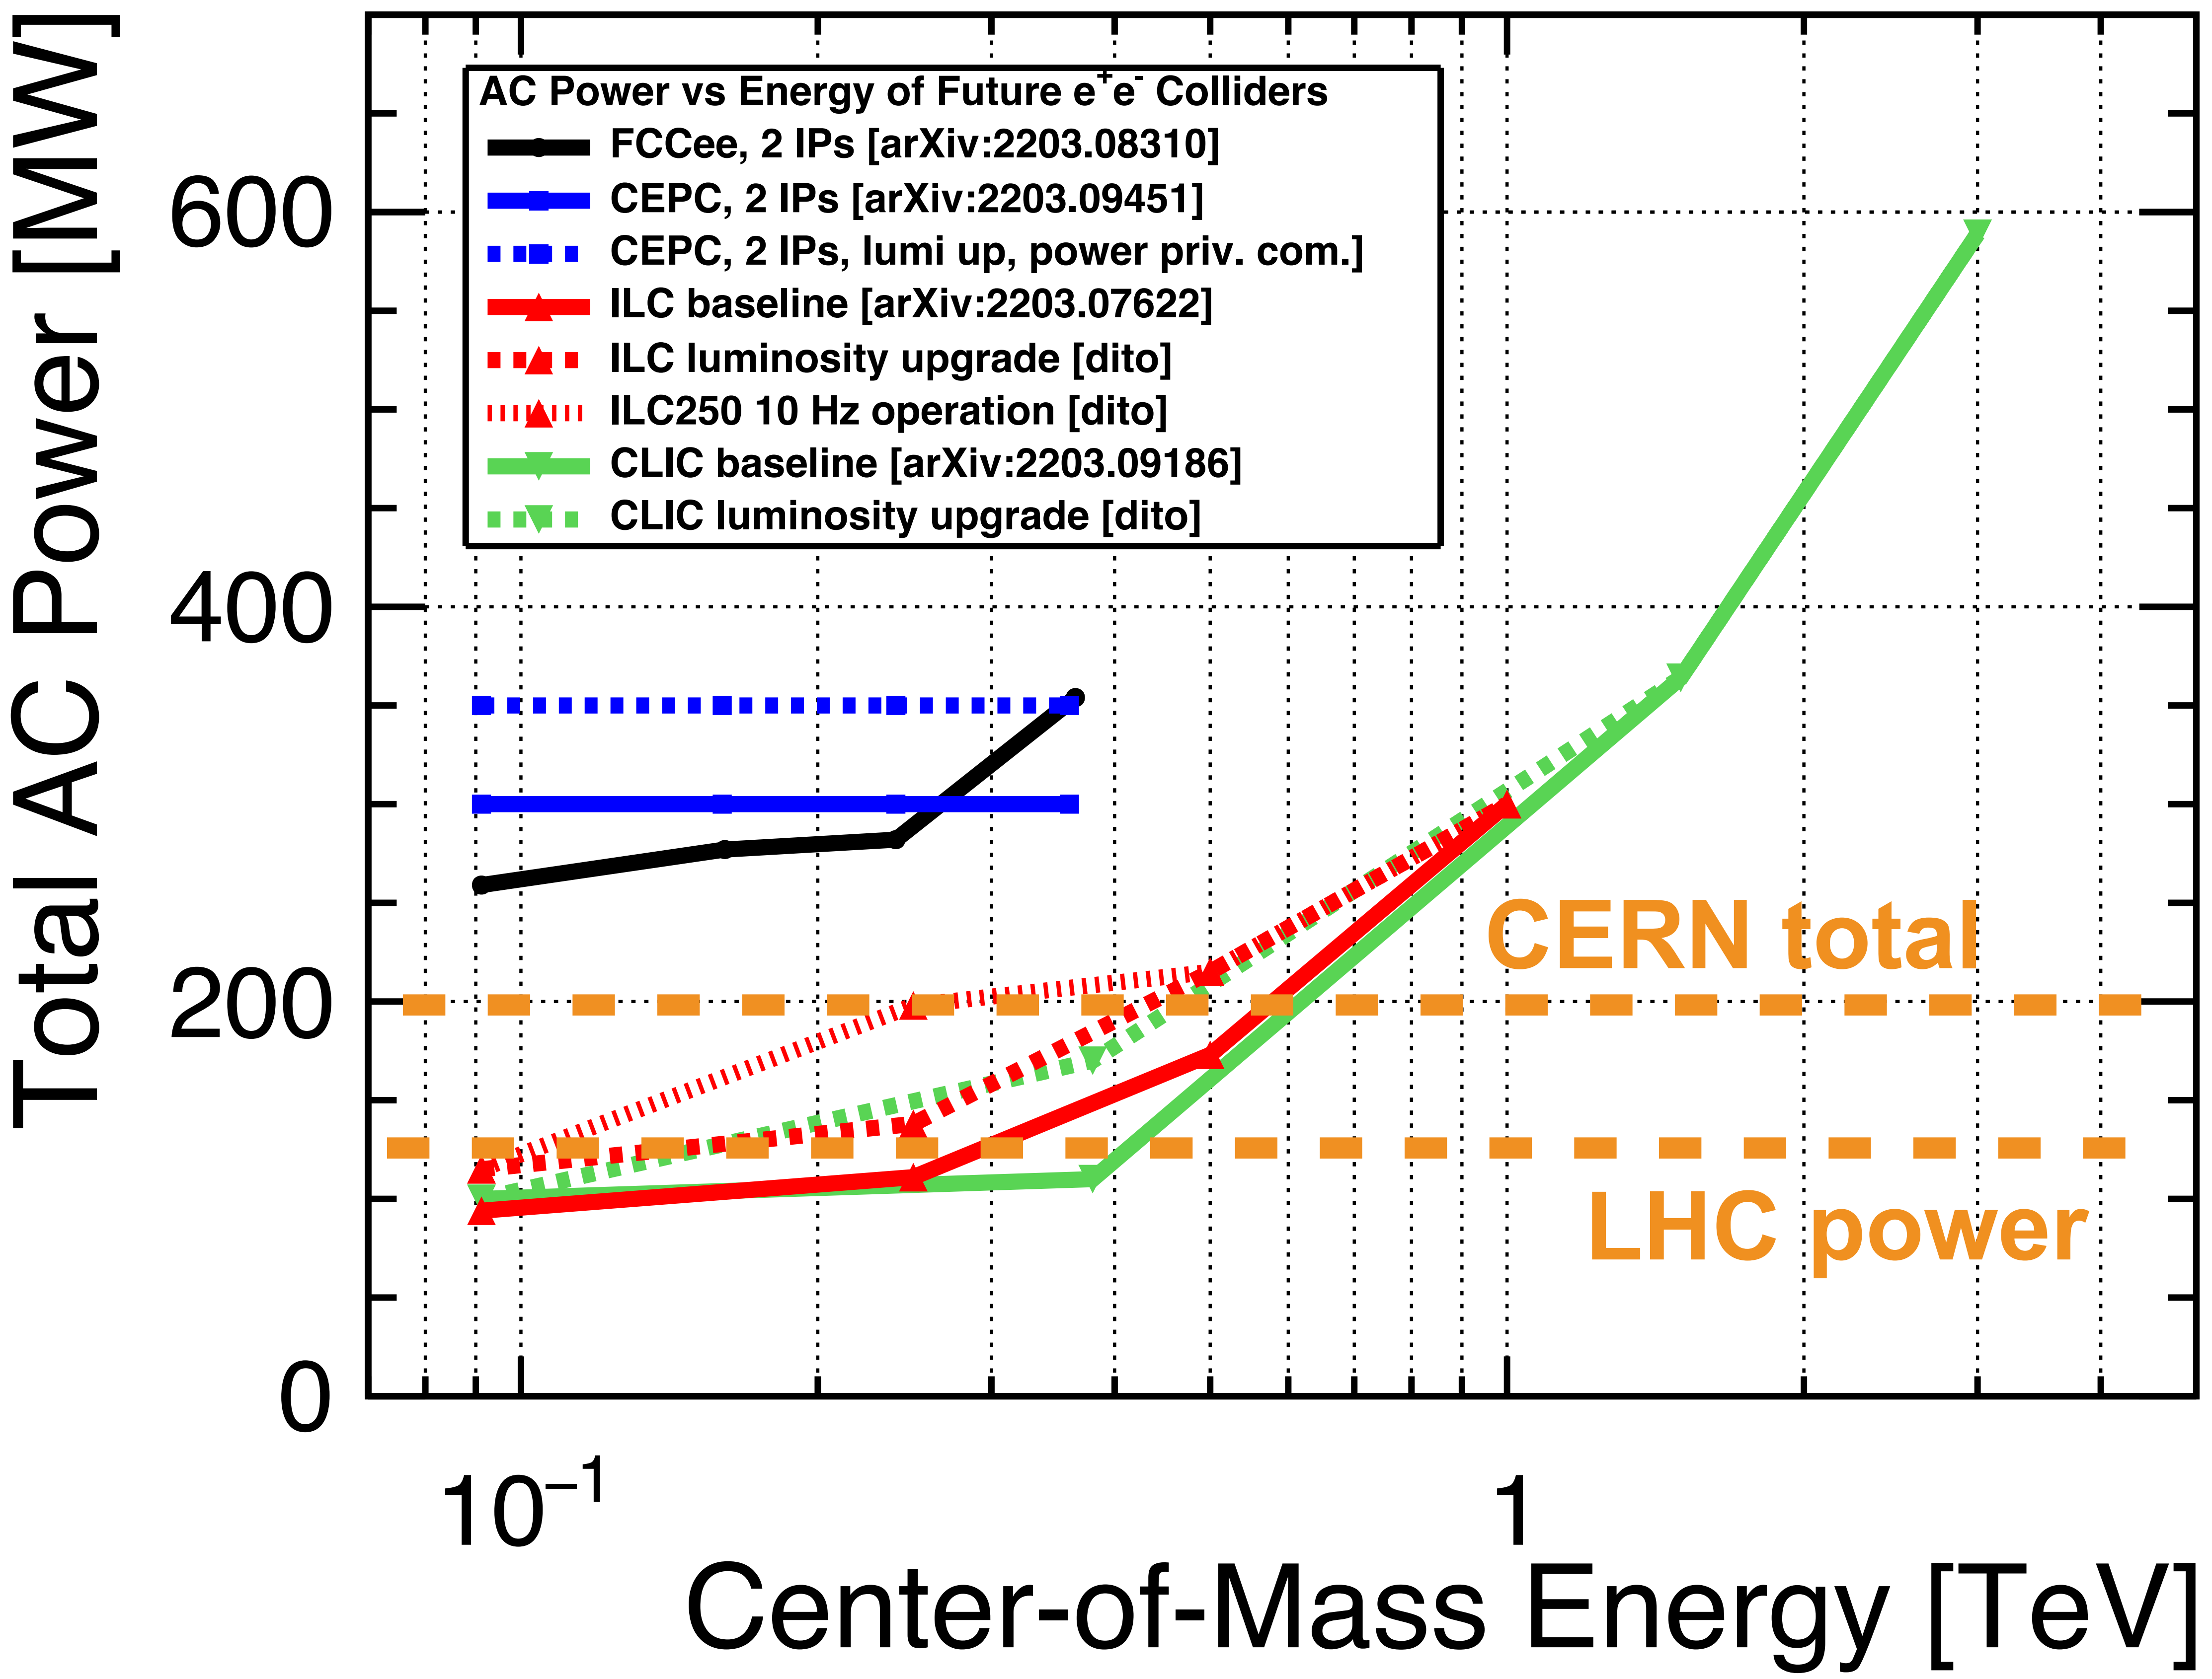


… and tomorrow: Sustainability of new Accelerators

Much more than CO2 equivalents…

minimal use of resources to reach physics goals

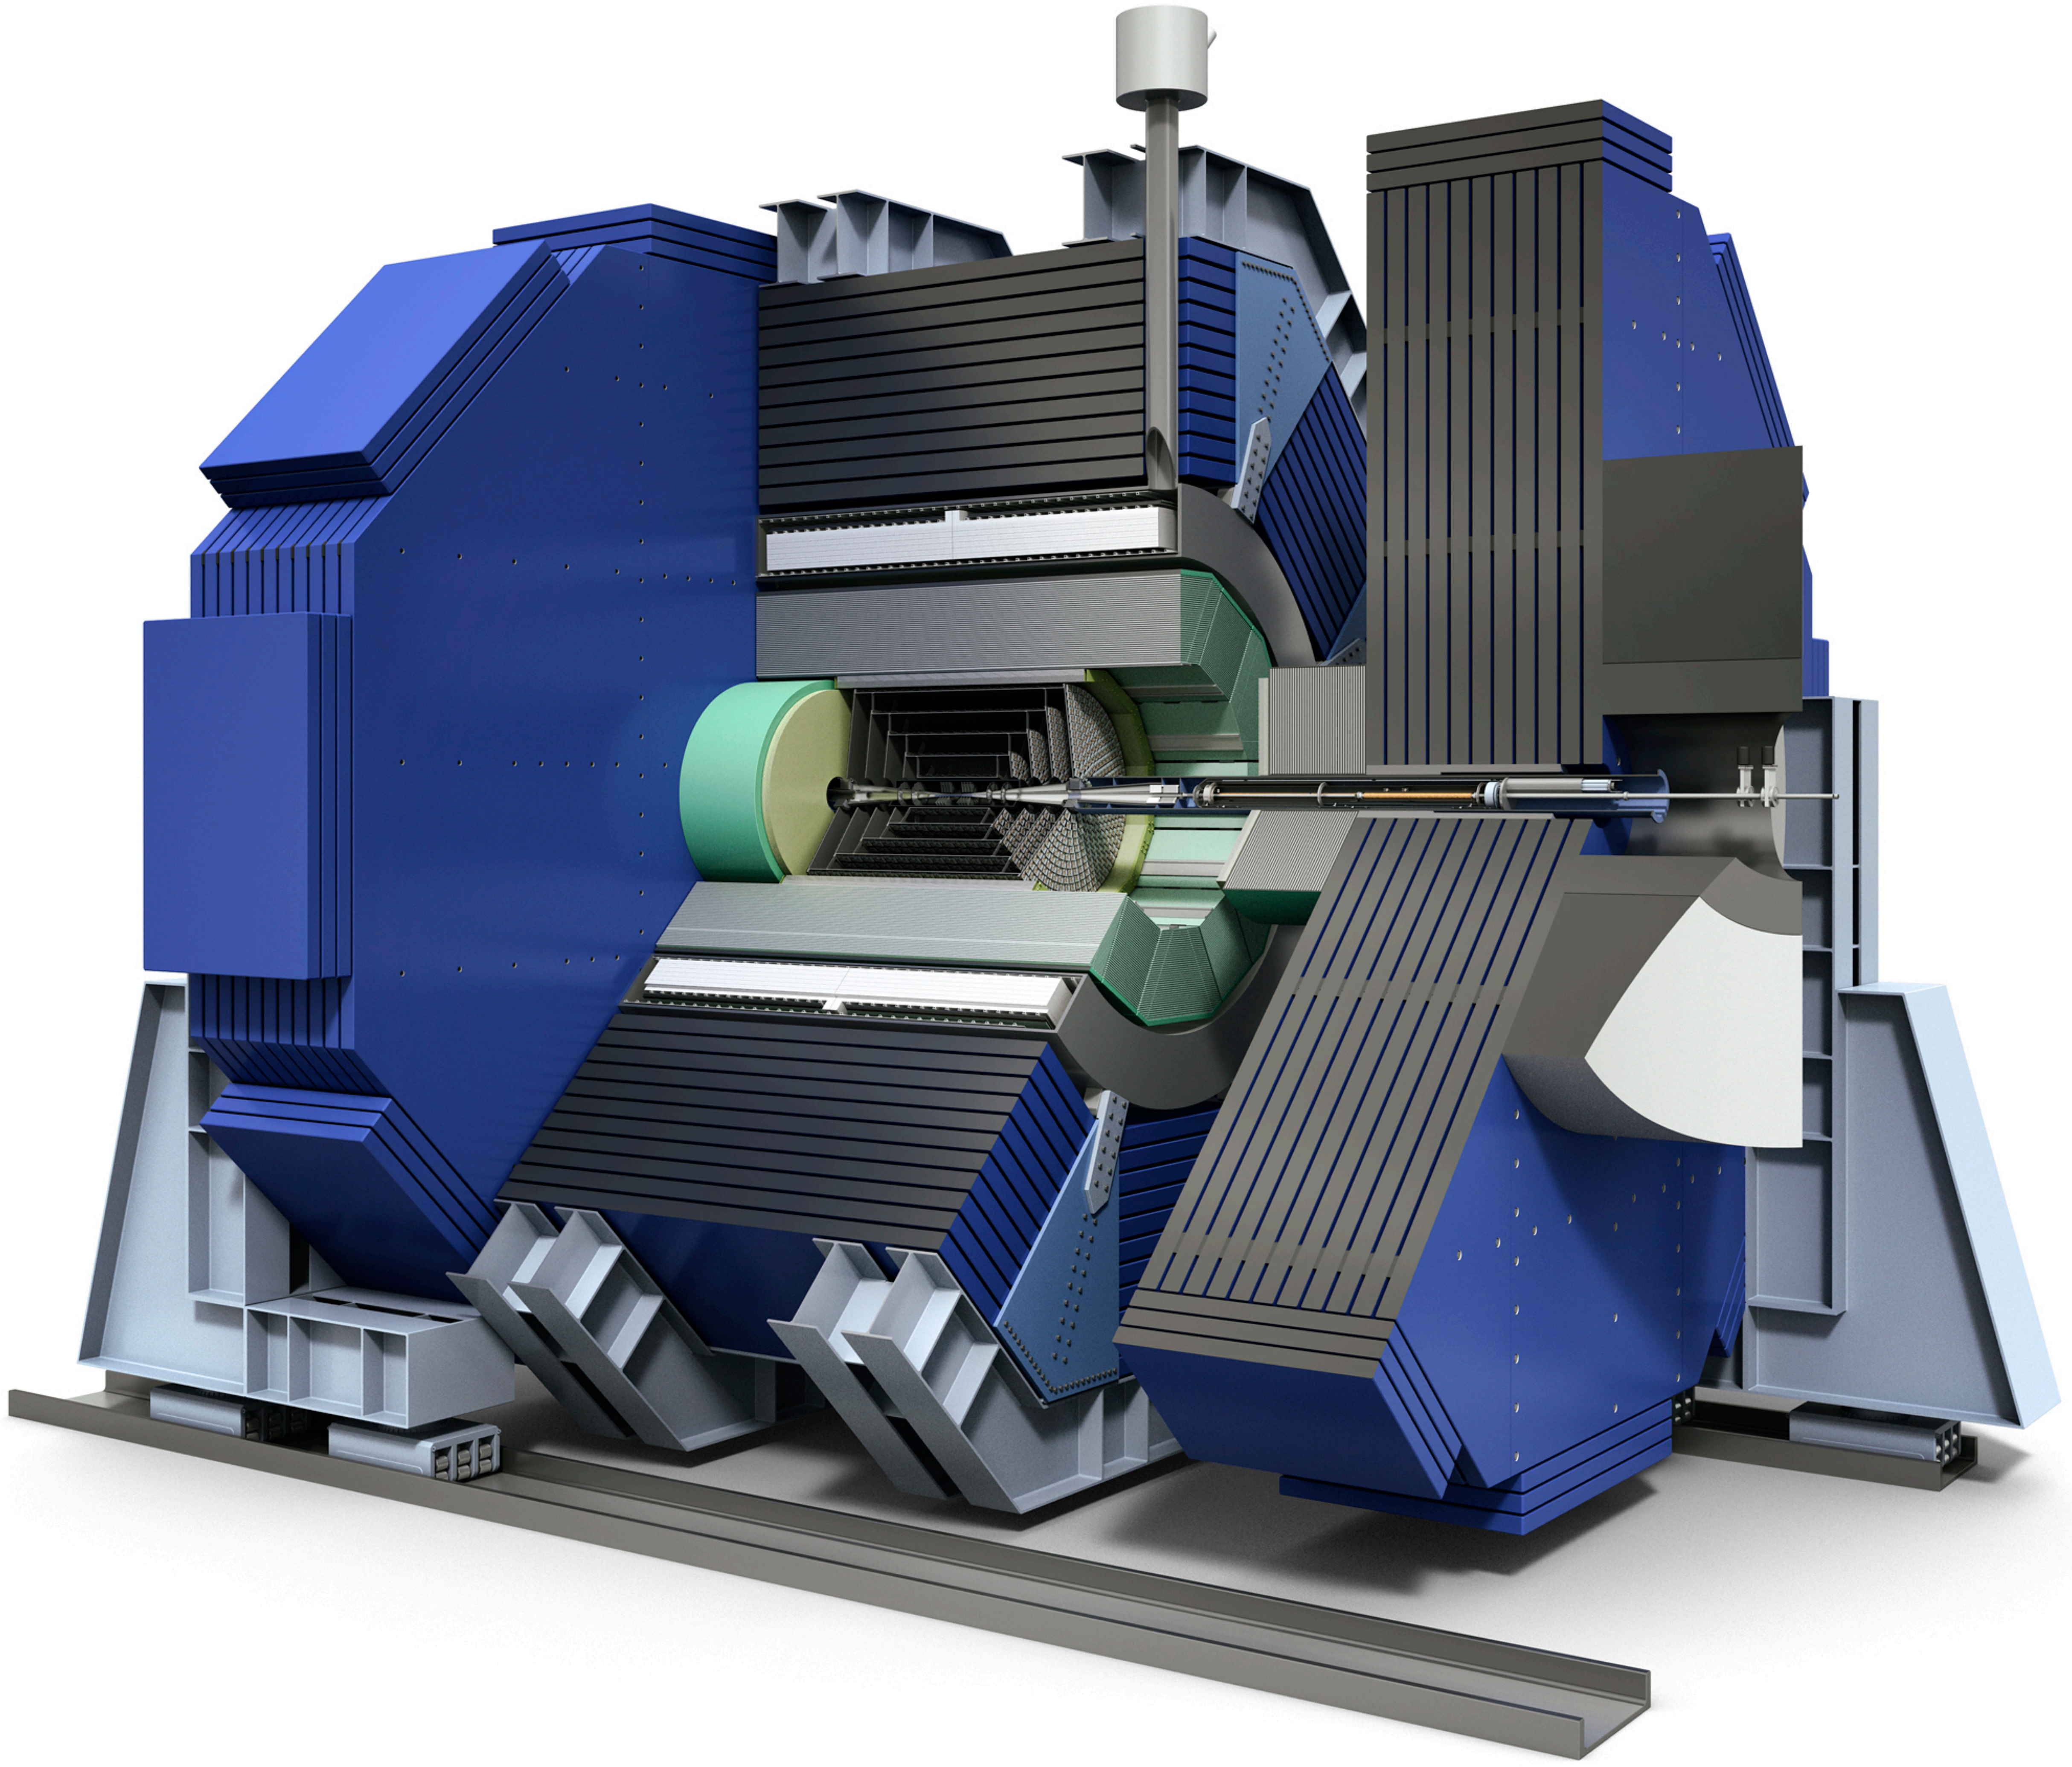
- Operation -> **total electrical site power**:
  - **minimize**:
    - even if - or especially if - all power will come from regenerative sources, the competition with other human needs will be high
    - optimizing all components for minimal energy consumtion
  - **be flexible**:
    - must be able to handle large variations in availability of regenerative power
    - could cooling capacities be used as buffer for energy, also for society in general?
- Constuction, concrete etc
  - **tunnel as short as possible**
  - use concrete with low(er) CO2 emission
  - avoid usage of rare earths and other problematic substances

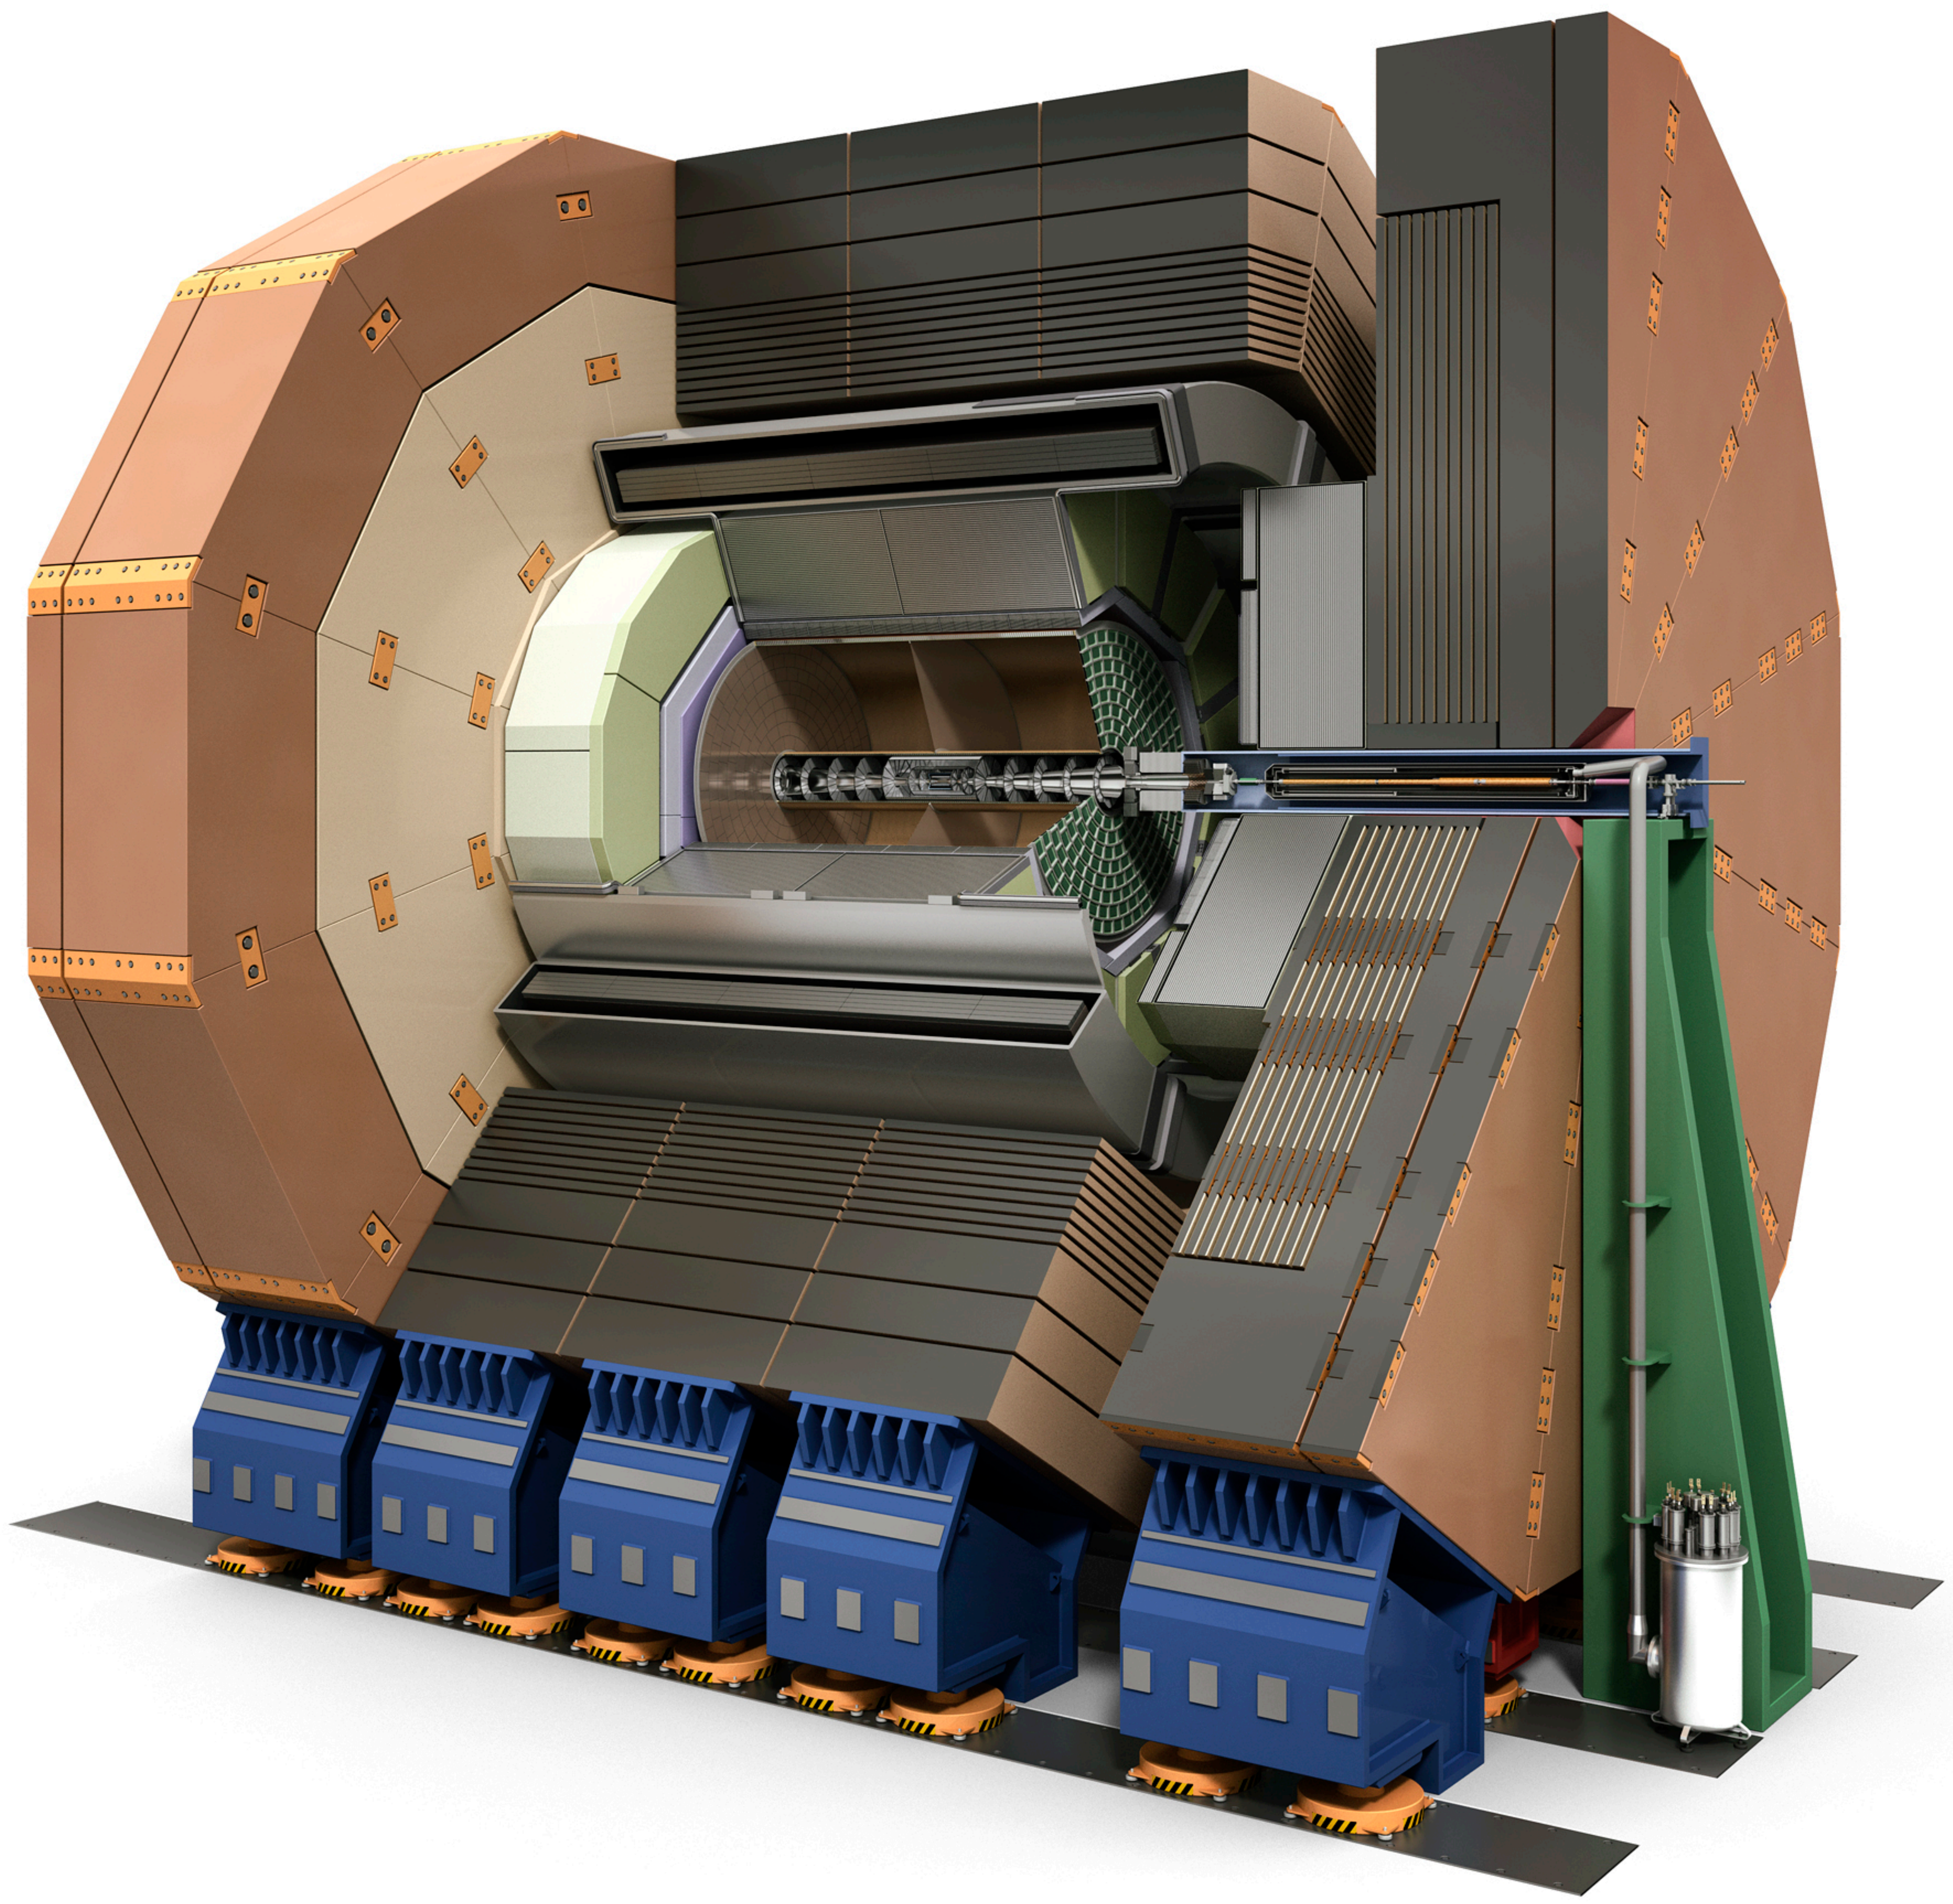


The ILC Detector Concepts
& Selected Physics Analyses Examples

ILC Detectors

SiD & ILD





ILC Detectors

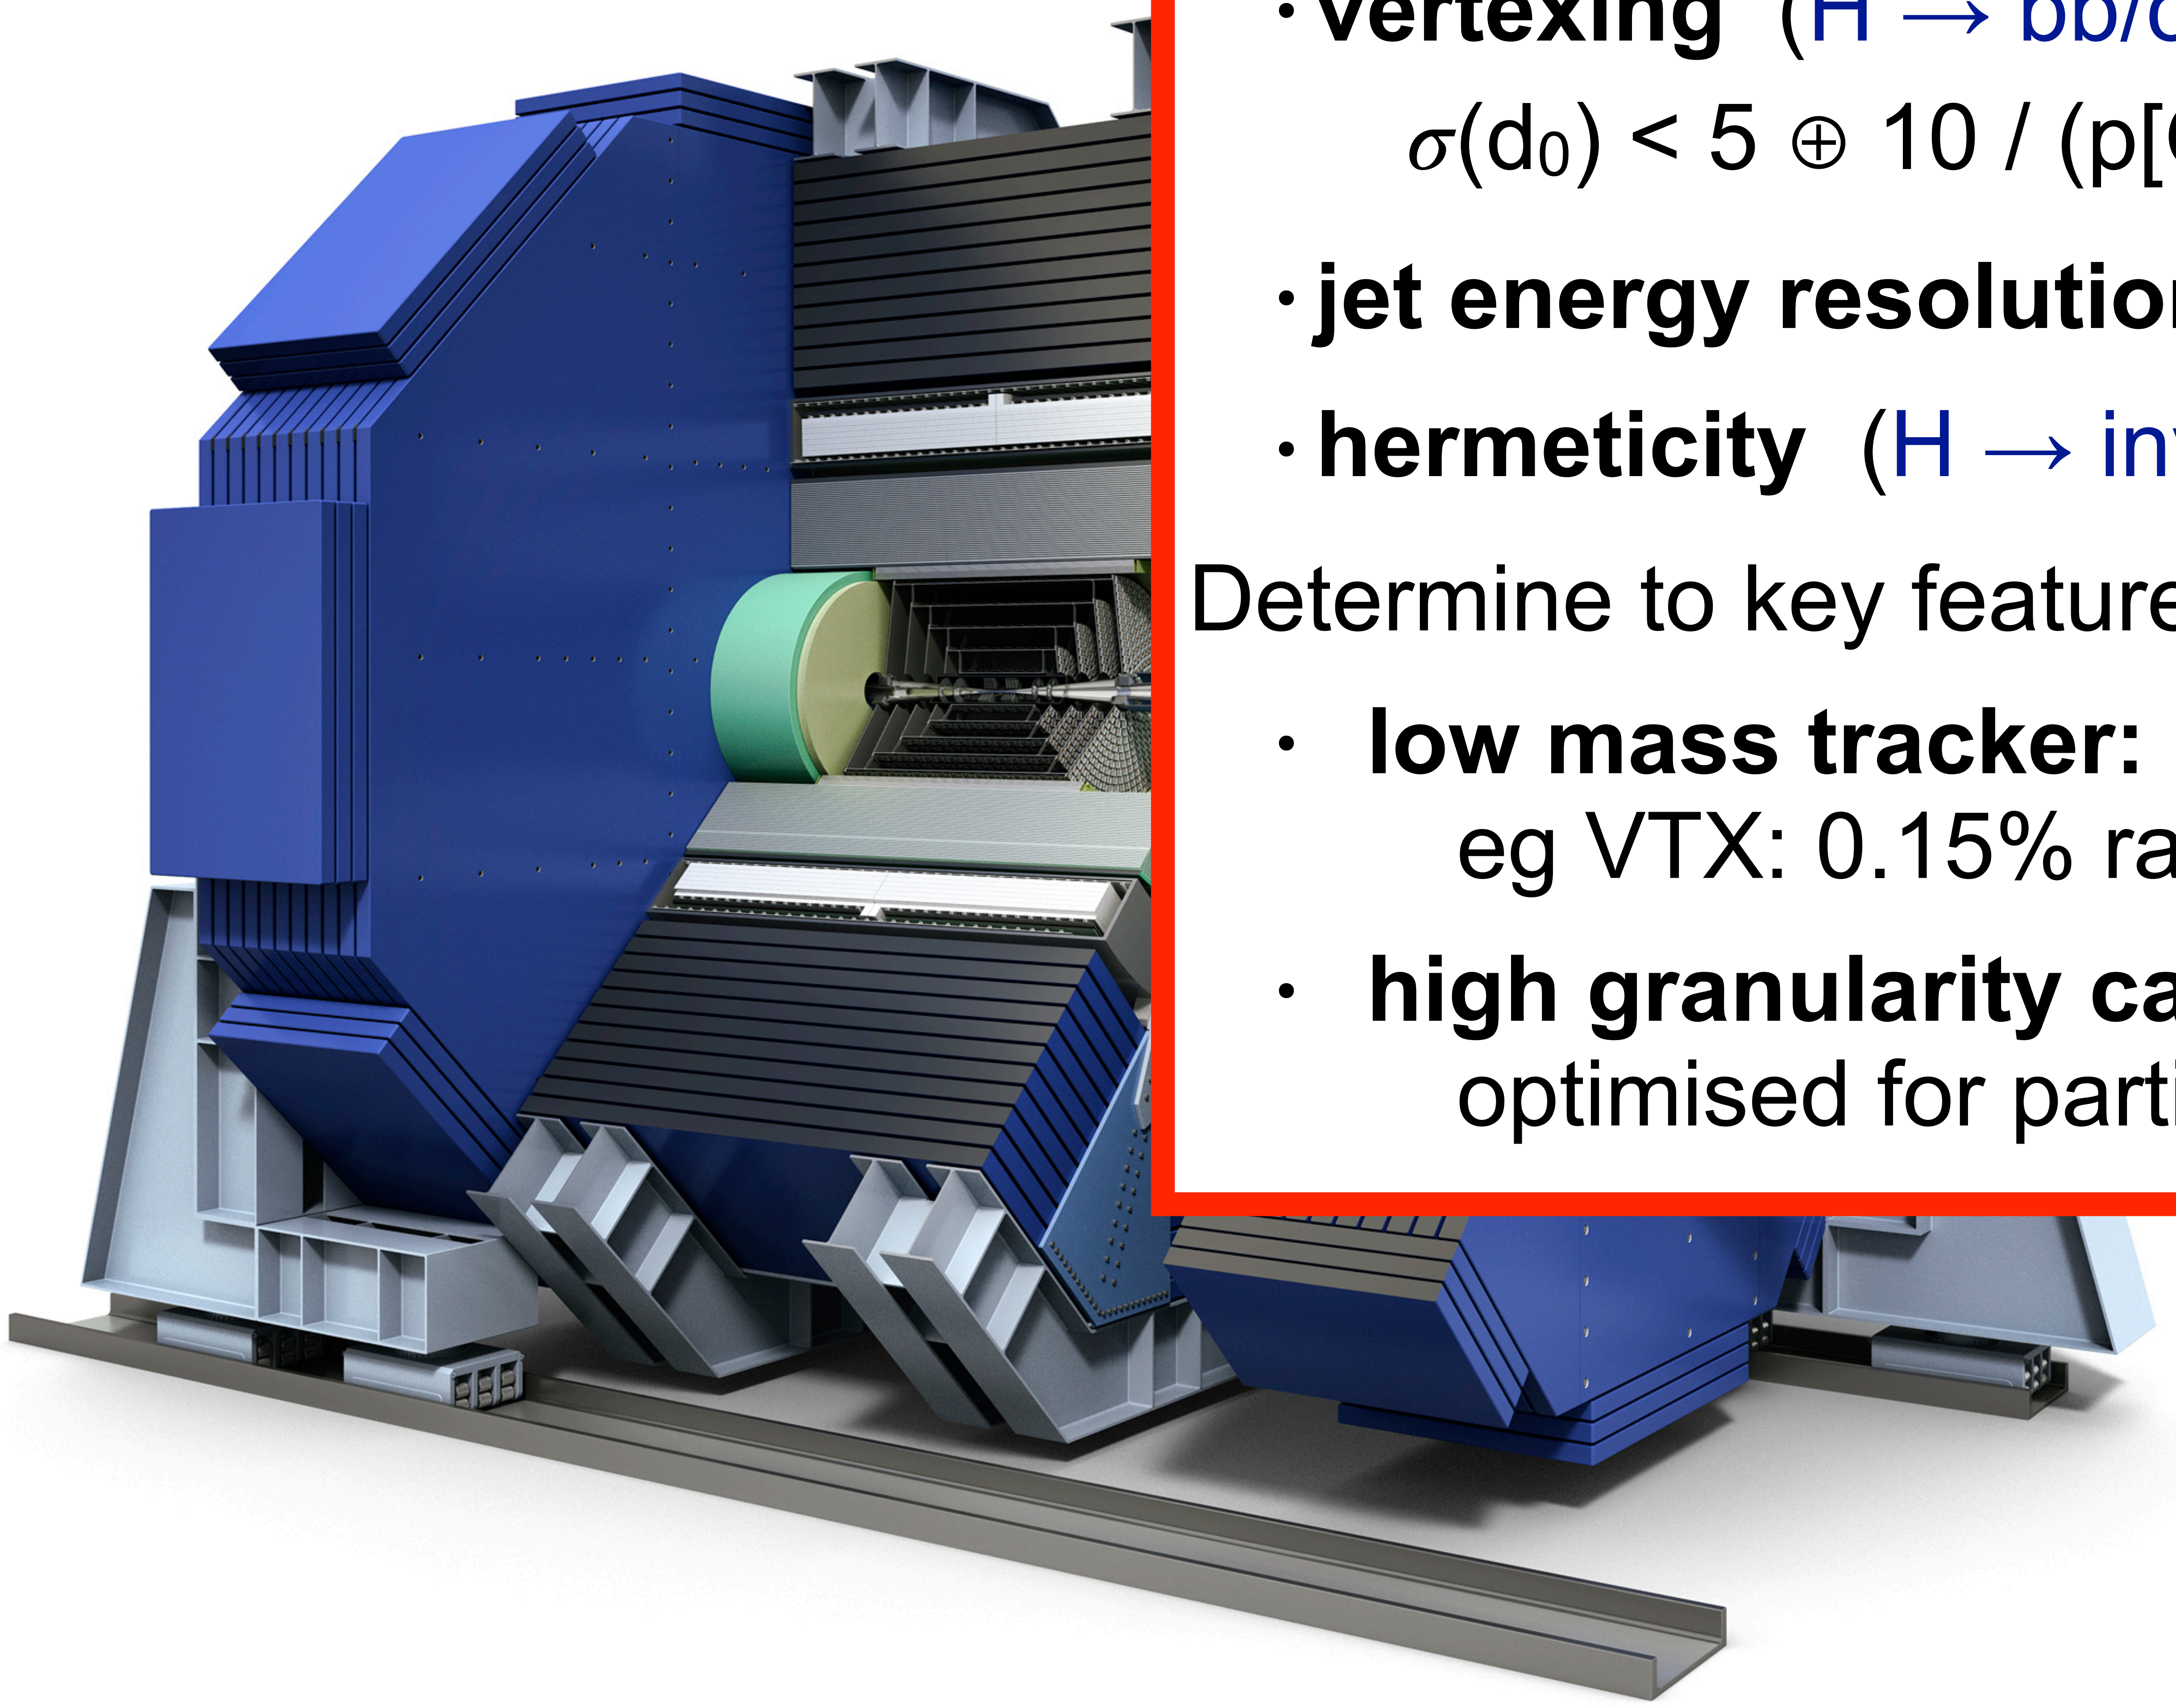
SiD & ILD

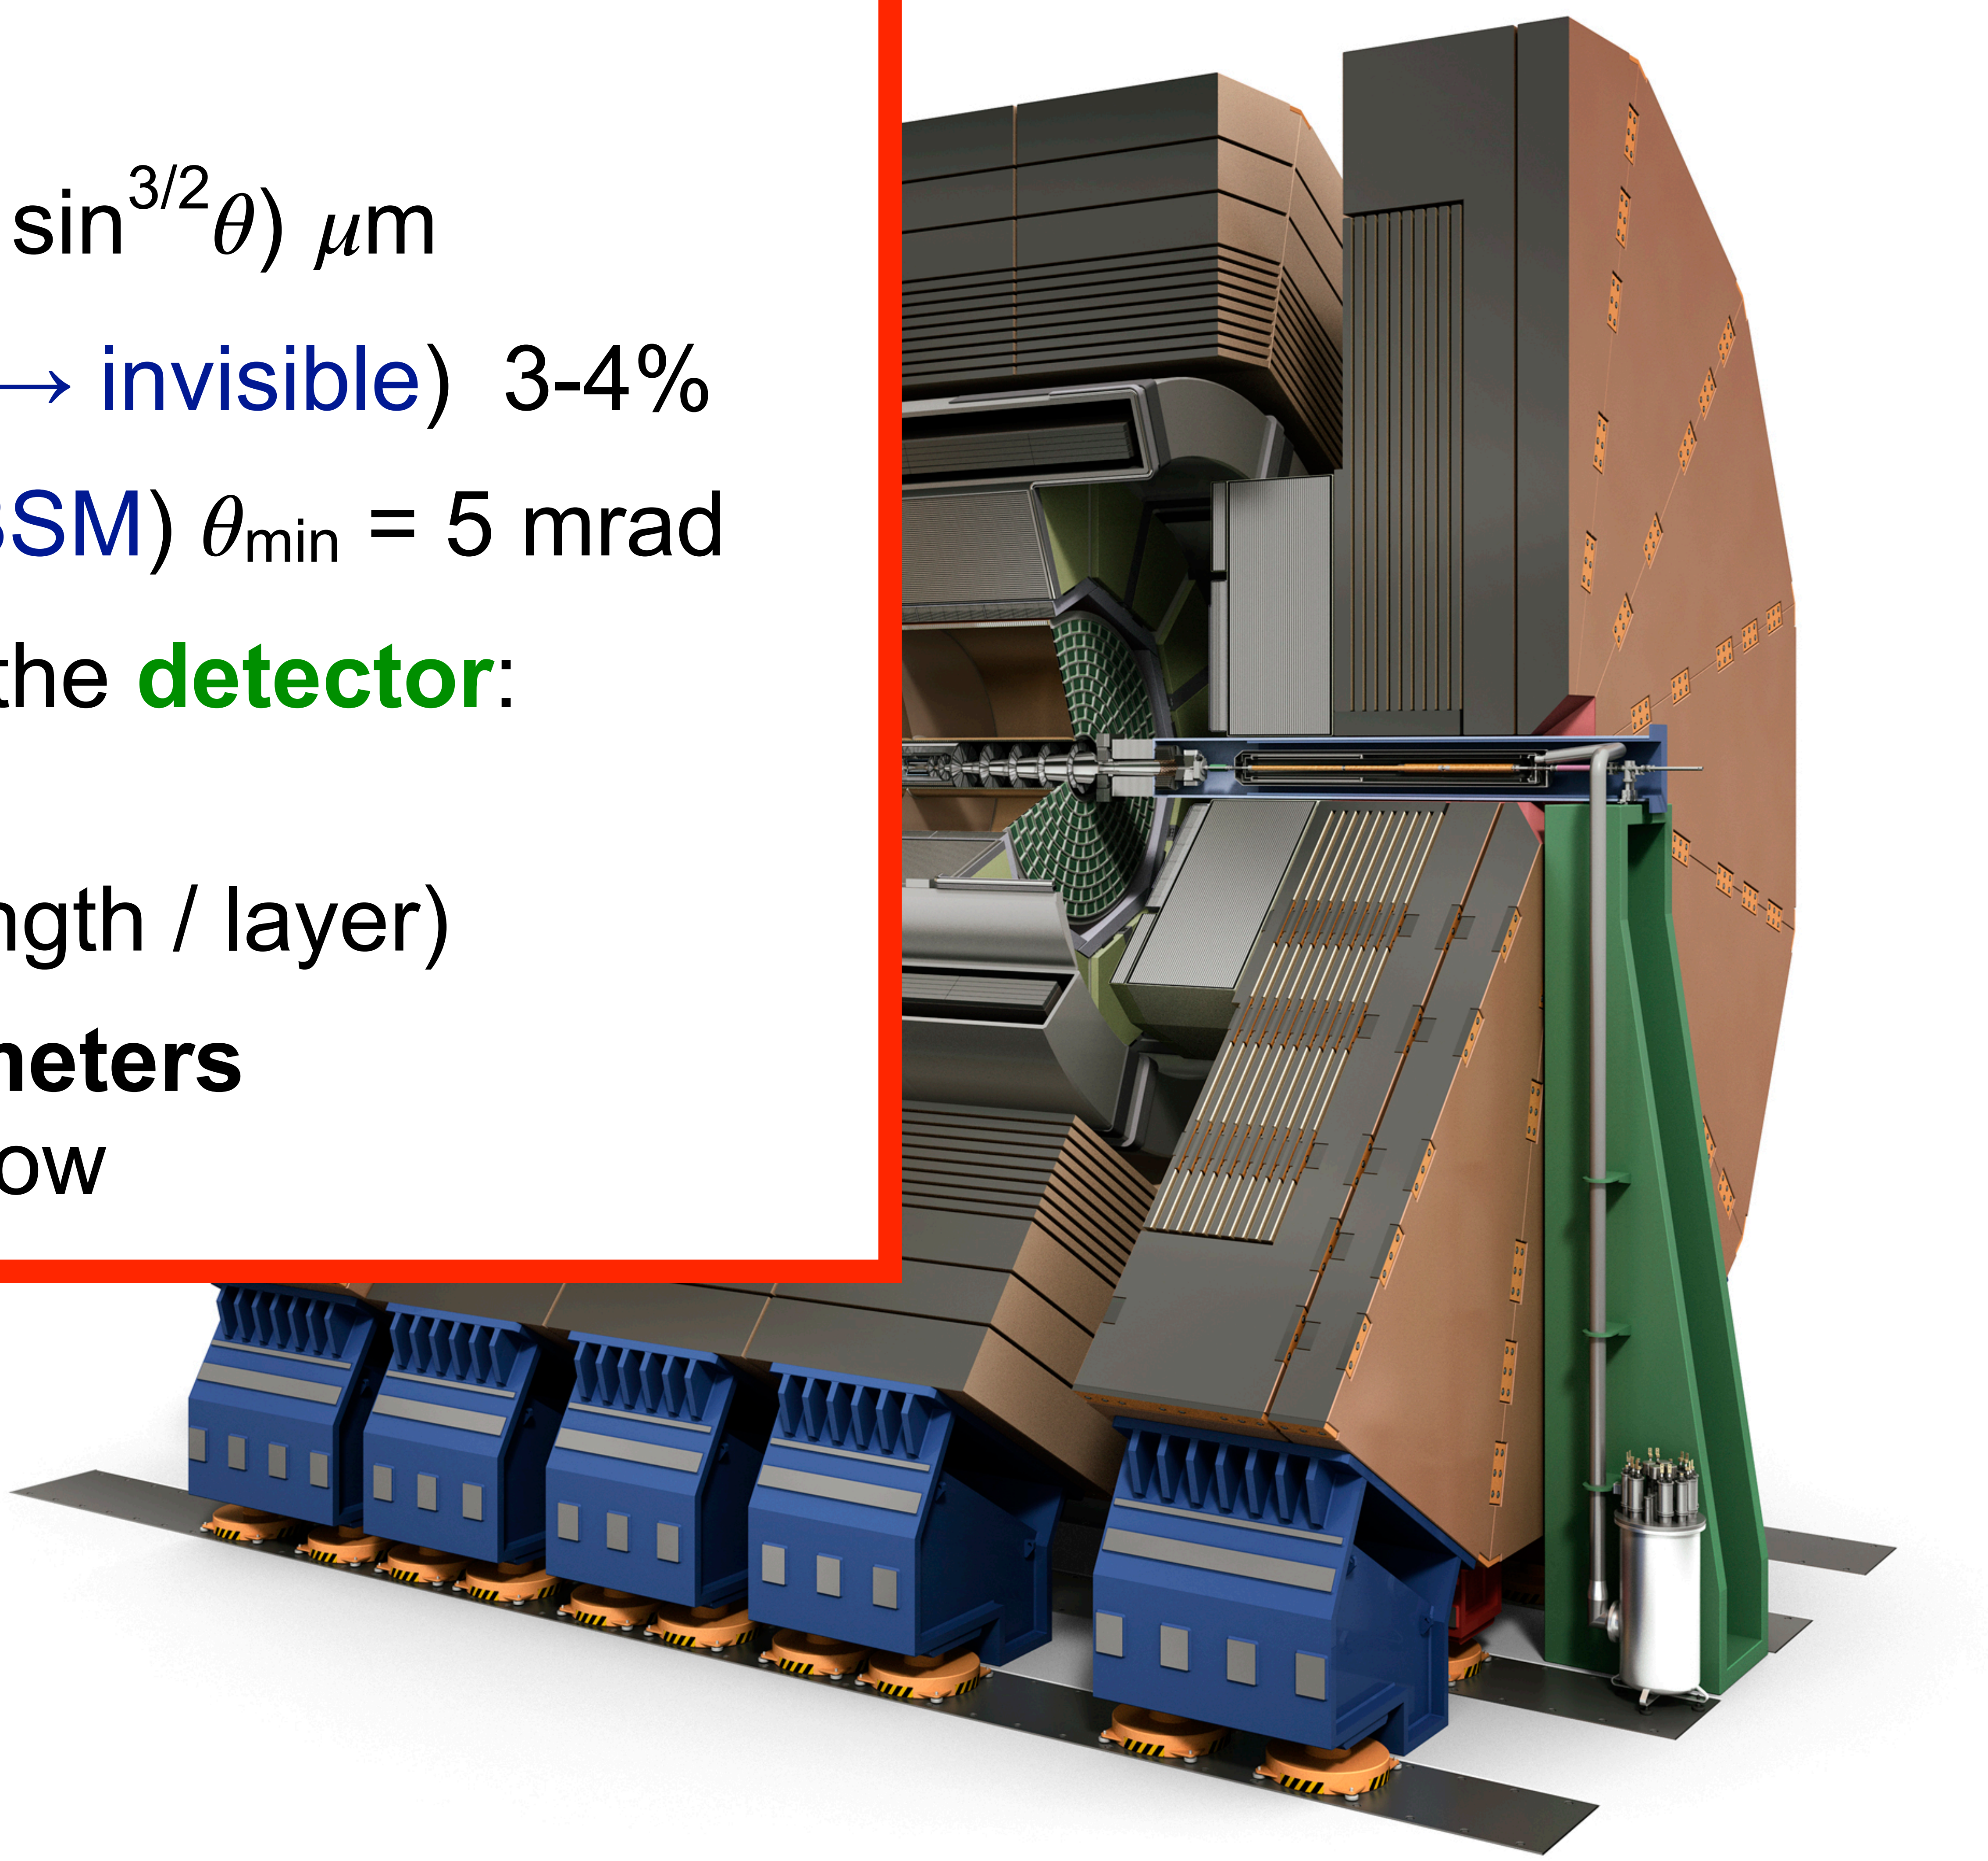
Key requirements from physics:

- **p_t resolution** (total ZH x-section)
  $\sigma(1/p_t) = 2 \times 10^{-5}\ \text{GeV}^{-1} \oplus 1 \times 10^{-3} / (p_t \sin^{1/2}\theta)$
- **vertexing** ($H \rightarrow bb/cc/\tau\tau$)
  $\sigma(d_0) < 5 \oplus 10 / (p[\text{GeV}] \sin^{3/2}\theta)\ \mu m$
- **jet energy resolution** ($H \rightarrow$ invisible) 3-4%
- **hermeticity** ($H \rightarrow$ invis, BSM) θ_{min} = 5 mrad

Determine to key features of the detector:

- **low mass tracker:**
  eg VTX: 0.15% rad. length / layer)
- **high granularity calorimeters**
  optimised for particle flow





ILC Detectors

SiD & ILD

Key requirements from physics:

- **p_t resolution** (total ZH x-section)
  $\sigma(1/p_t) = 2 \times 10^{-5}\ \mathrm{GeV}^{-1} \oplus 1 \times 10^{-3} / (p_t \sin^{1/2}\theta)$
- **vertexing** (H → bb/cc/ττ)
  $\sigma(d_0) < 5 \oplus 10 / (p[\mathrm{GeV}] \sin^{3/2}\theta)\ \mu m$
- **jet energy resolution** (H → invisible) 3-4%
- **hermeticity** (H → invis, BSM) θ_{min} = 5 mrad

Determine to key features of the detector:

- **low mass tracker:**
  eg VTX: 0.15% rad. length / layer)
- **high granularity calorimeters**
  optimised for particle flow

- **high granularity calorimeters**
  optimised for particle flow

≈ CMS / 40

≈ CMS / 4

≈ ATLAS / 2

≈ ATLAS / 3

Possible since experimental environment at ILC very different from LHC:

- **much lower backgrounds**
- **much less radiation**
- **much lower collision rate**

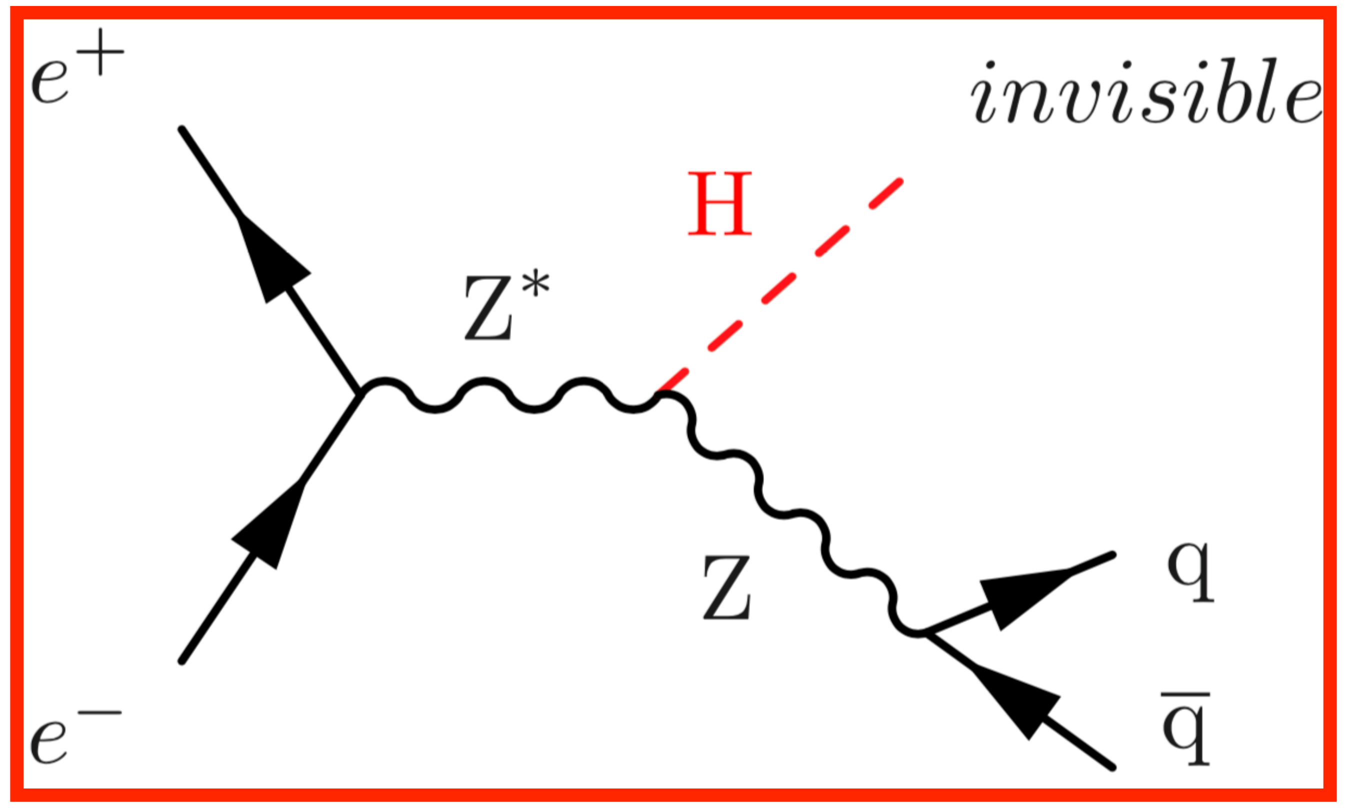
enable

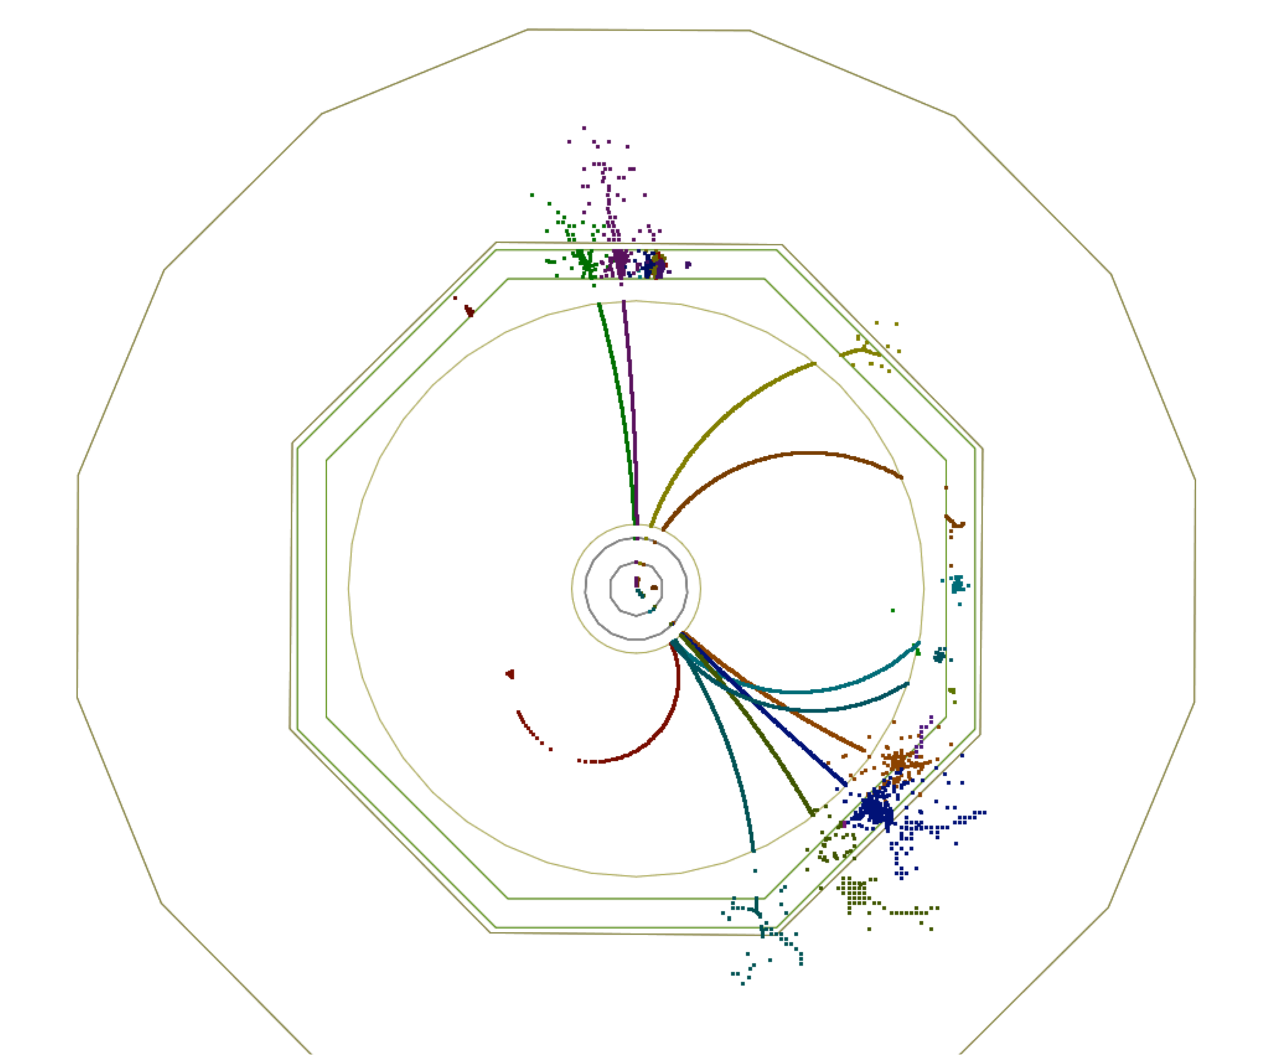
- **passive cooling only**
  => low material budget
- **triggerless operation**

Example: Higgs decay to “invisible”

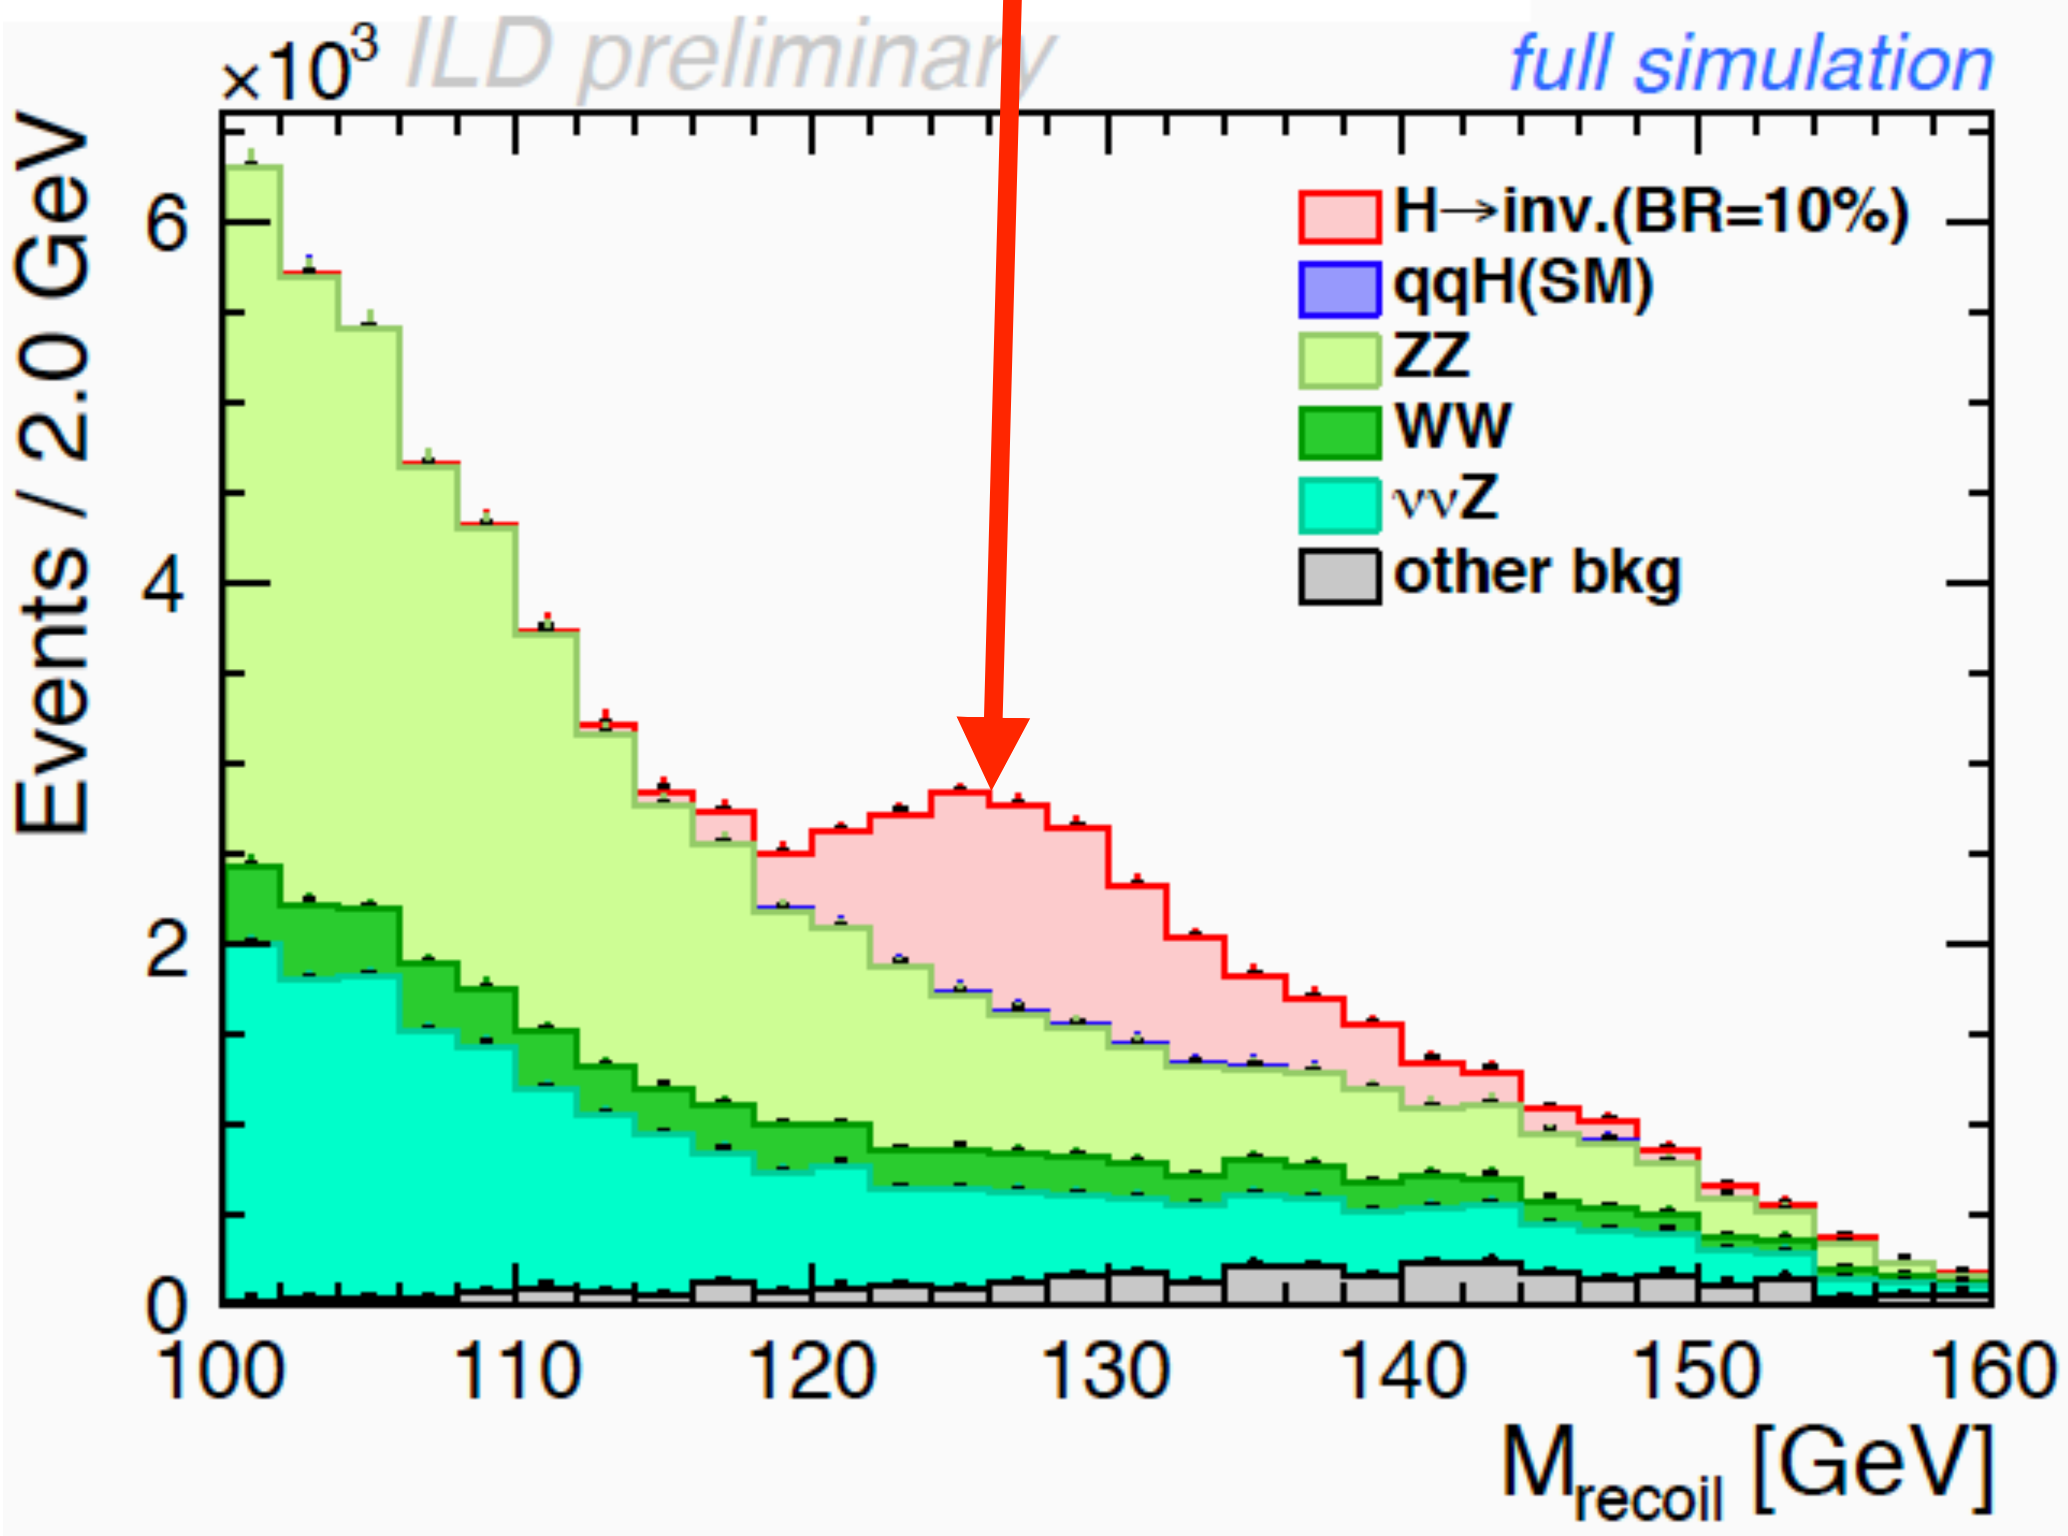
Dark Sector Portal?

- use $e^+e^- \to Z\,h$ process
- select a **visible final state (qq, ee, μμ) compatible with a Z decay**
- **recoiling against “nothing”**
- **if signal observed at ILC: discovery! Of Dark Matter?**
- **if no signal observed at ILC250: exclude BF > 0.16% at 95% CL (HL-LHC expectation: 2.5%, SM prediction: 0.12%)**





$e^+e^- \to q\bar{q}H \to qq$ inv in ILD detector



arXiv:2203.08330 (SiD) &
***PoS* EPS-HEP2019 (2020) 358 (ILD)**

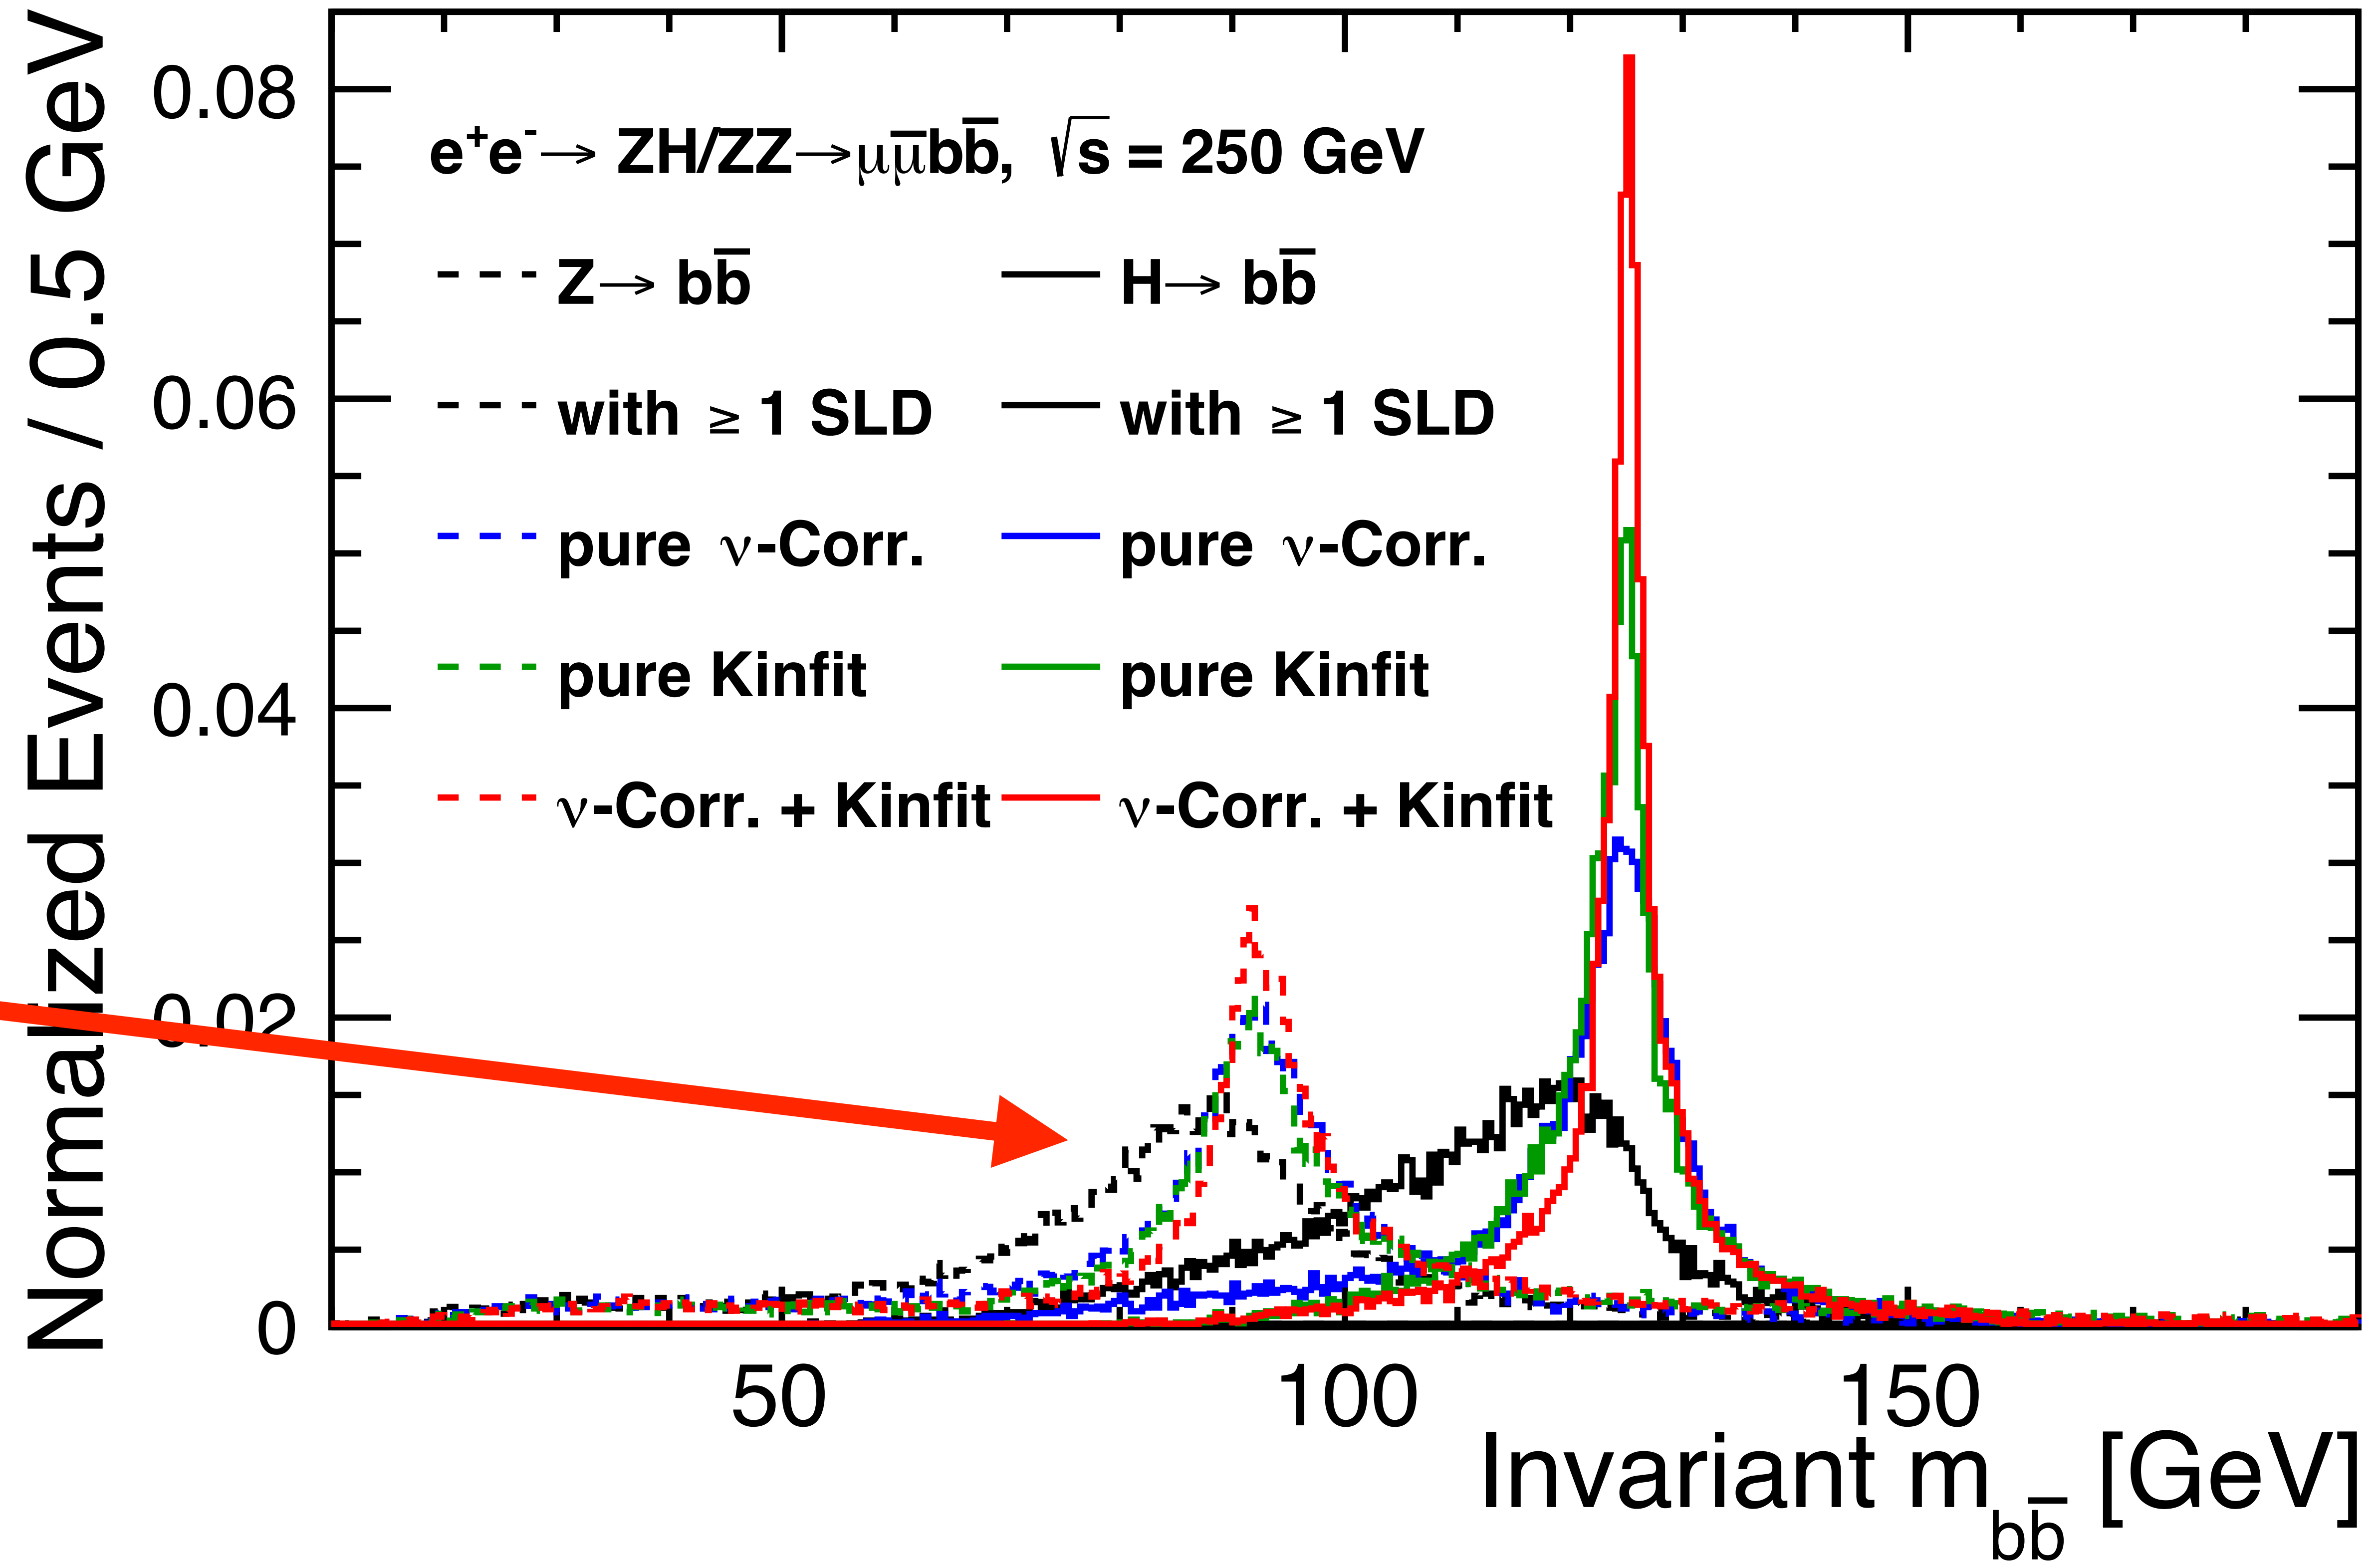
Recent developments

Improvements in reconstructing Z/H -> hadrons (Y Radkhorrami, L. Reichenbach)

- correct semi-leptonic b/c decays
  - identify leptons in c- / b-jets
  - associate them to seondary / tertiary vertex
  - reconstruct neutrino kinematics (2-fold ambiguity)
- ErrorFlow (jet-by-jet covariance matrix estimate)
- feed both into kinematic fit
- (very) significant improvement in H->bb/cc and Z->bb/cc reconstruction
- ready to be applied to many analyses…



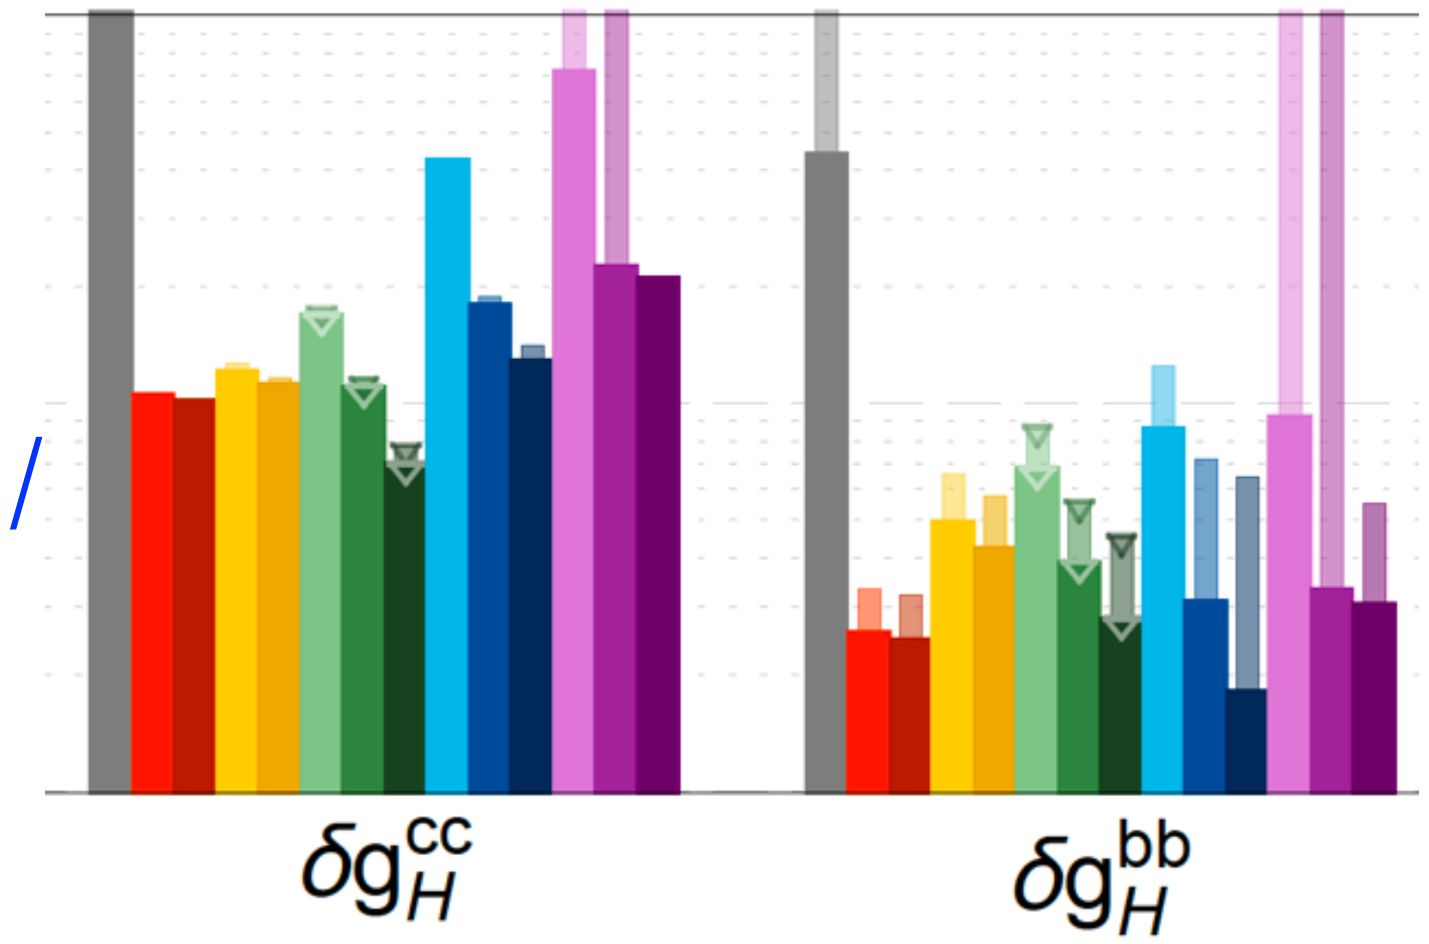
arXiv:2111.14775

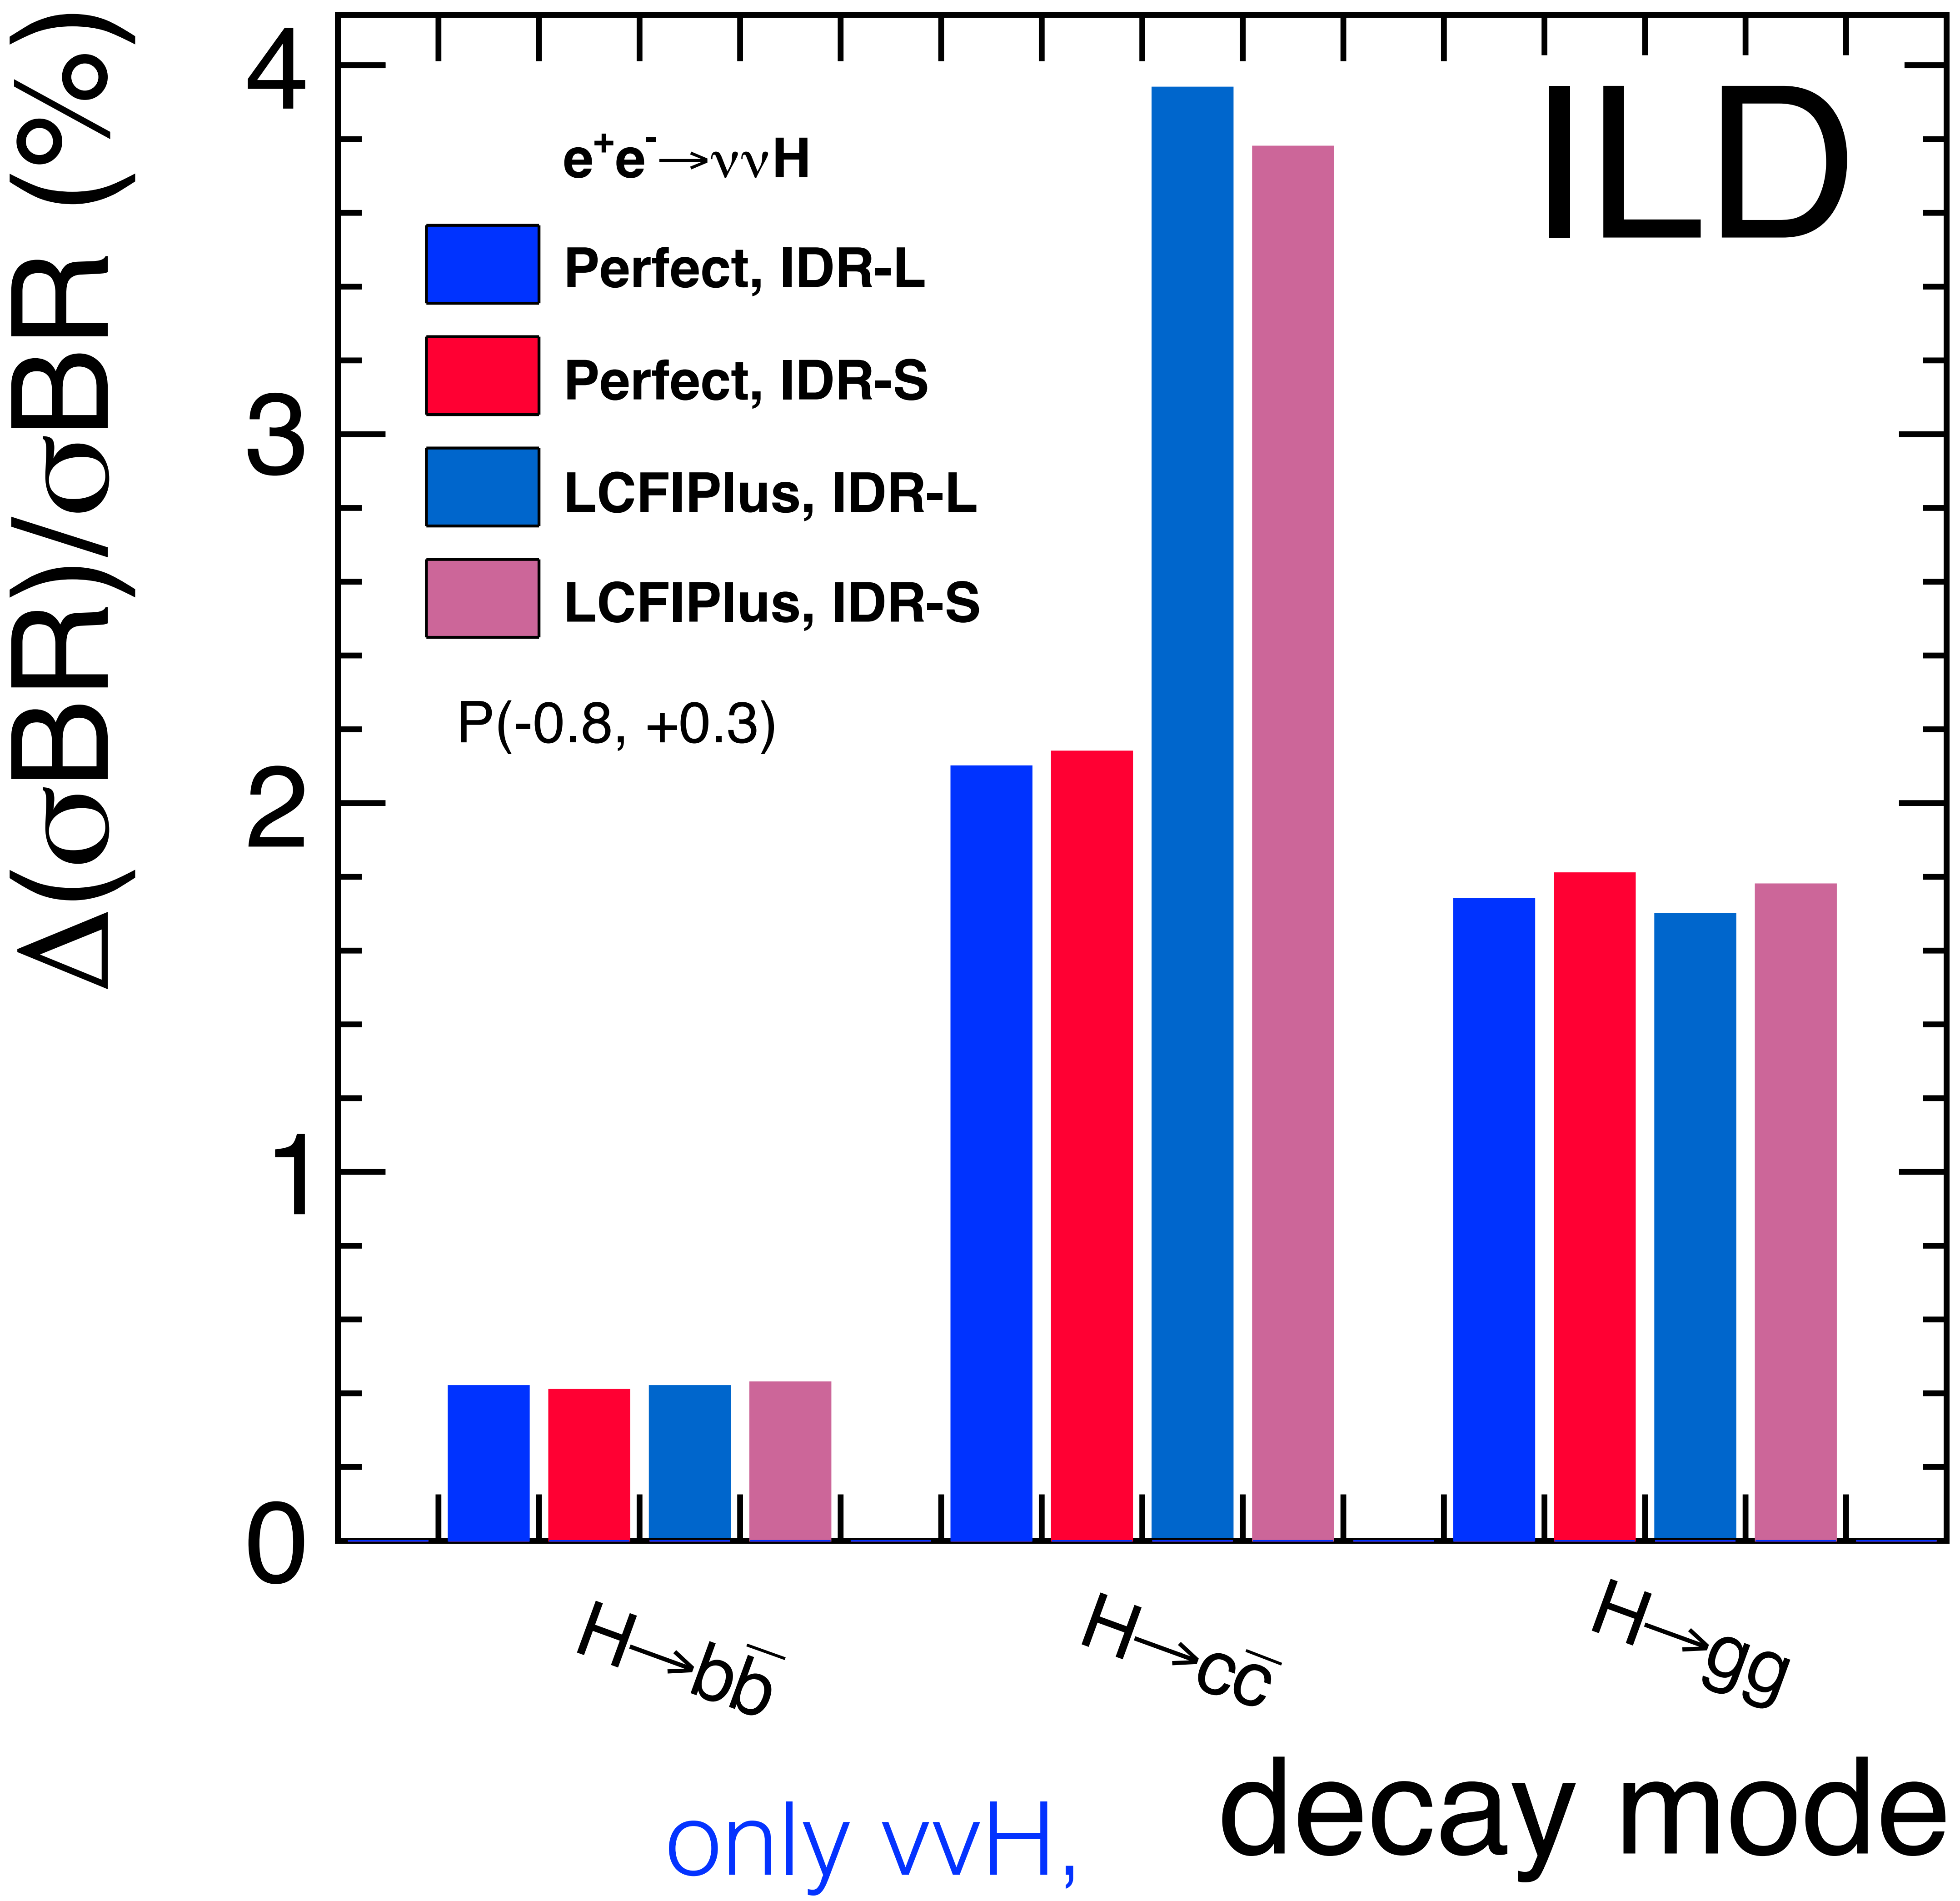
Higgs decay to bb/cc/gg

…the experimental situation

- use all visible decay modes of Z and ννH
- H->jets and Z->jets play important role!
- Example from ILD IDR:
  - **σxBR(bb) to ~0.4%** from one channel & data set alone
  - σxBR(cc) shows a lot (!) of room for improvement by smarter flavour tag algorithm

all channels / data sets





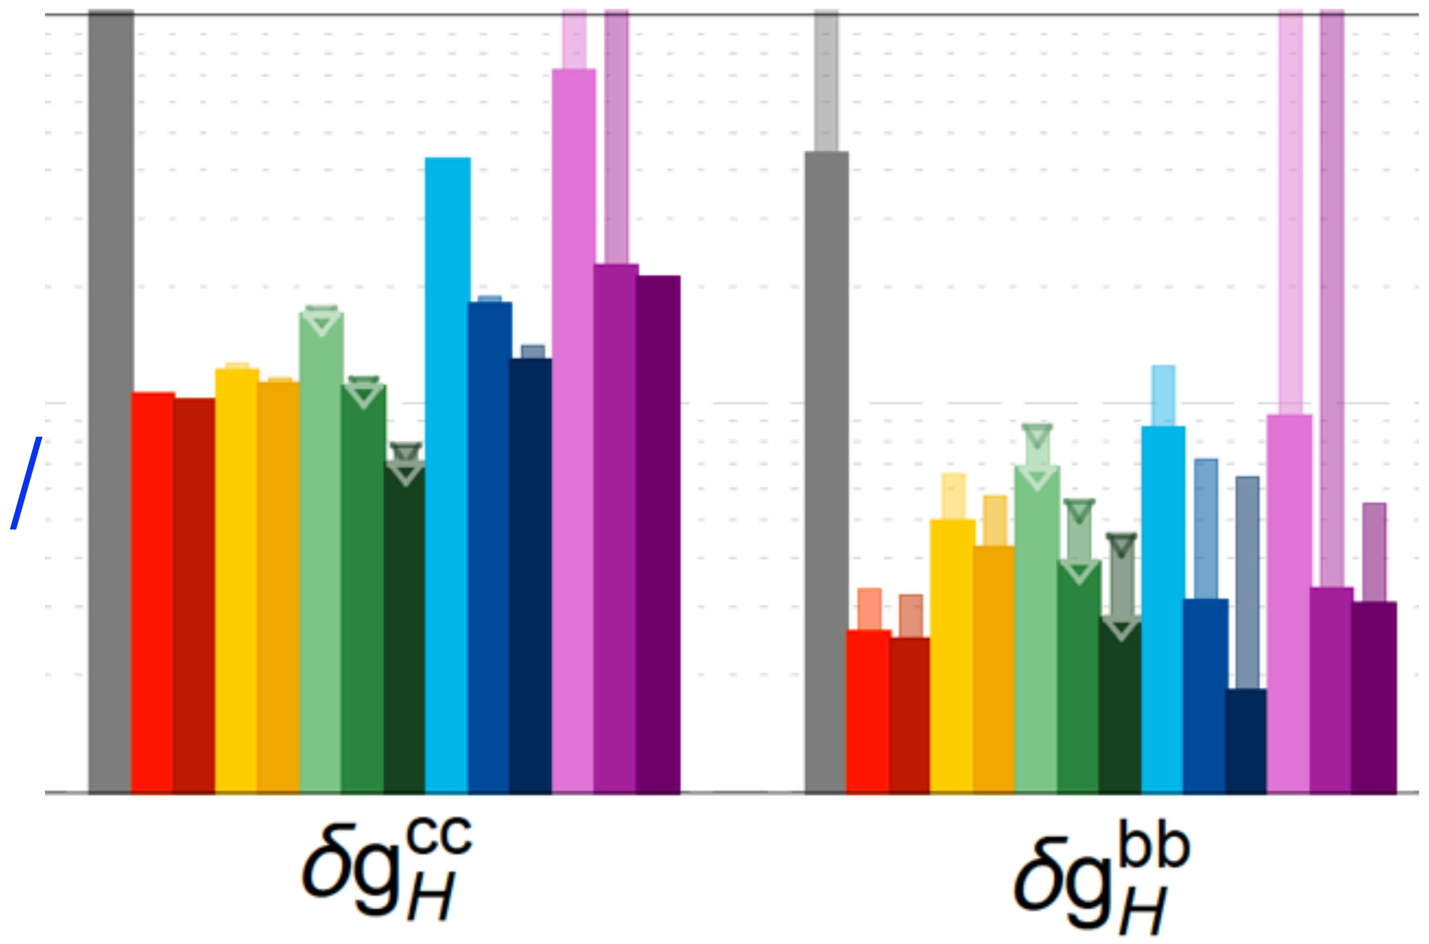
only ννH, 1.6ab-1 P(-0.8,+0.3) @ 500 GeV

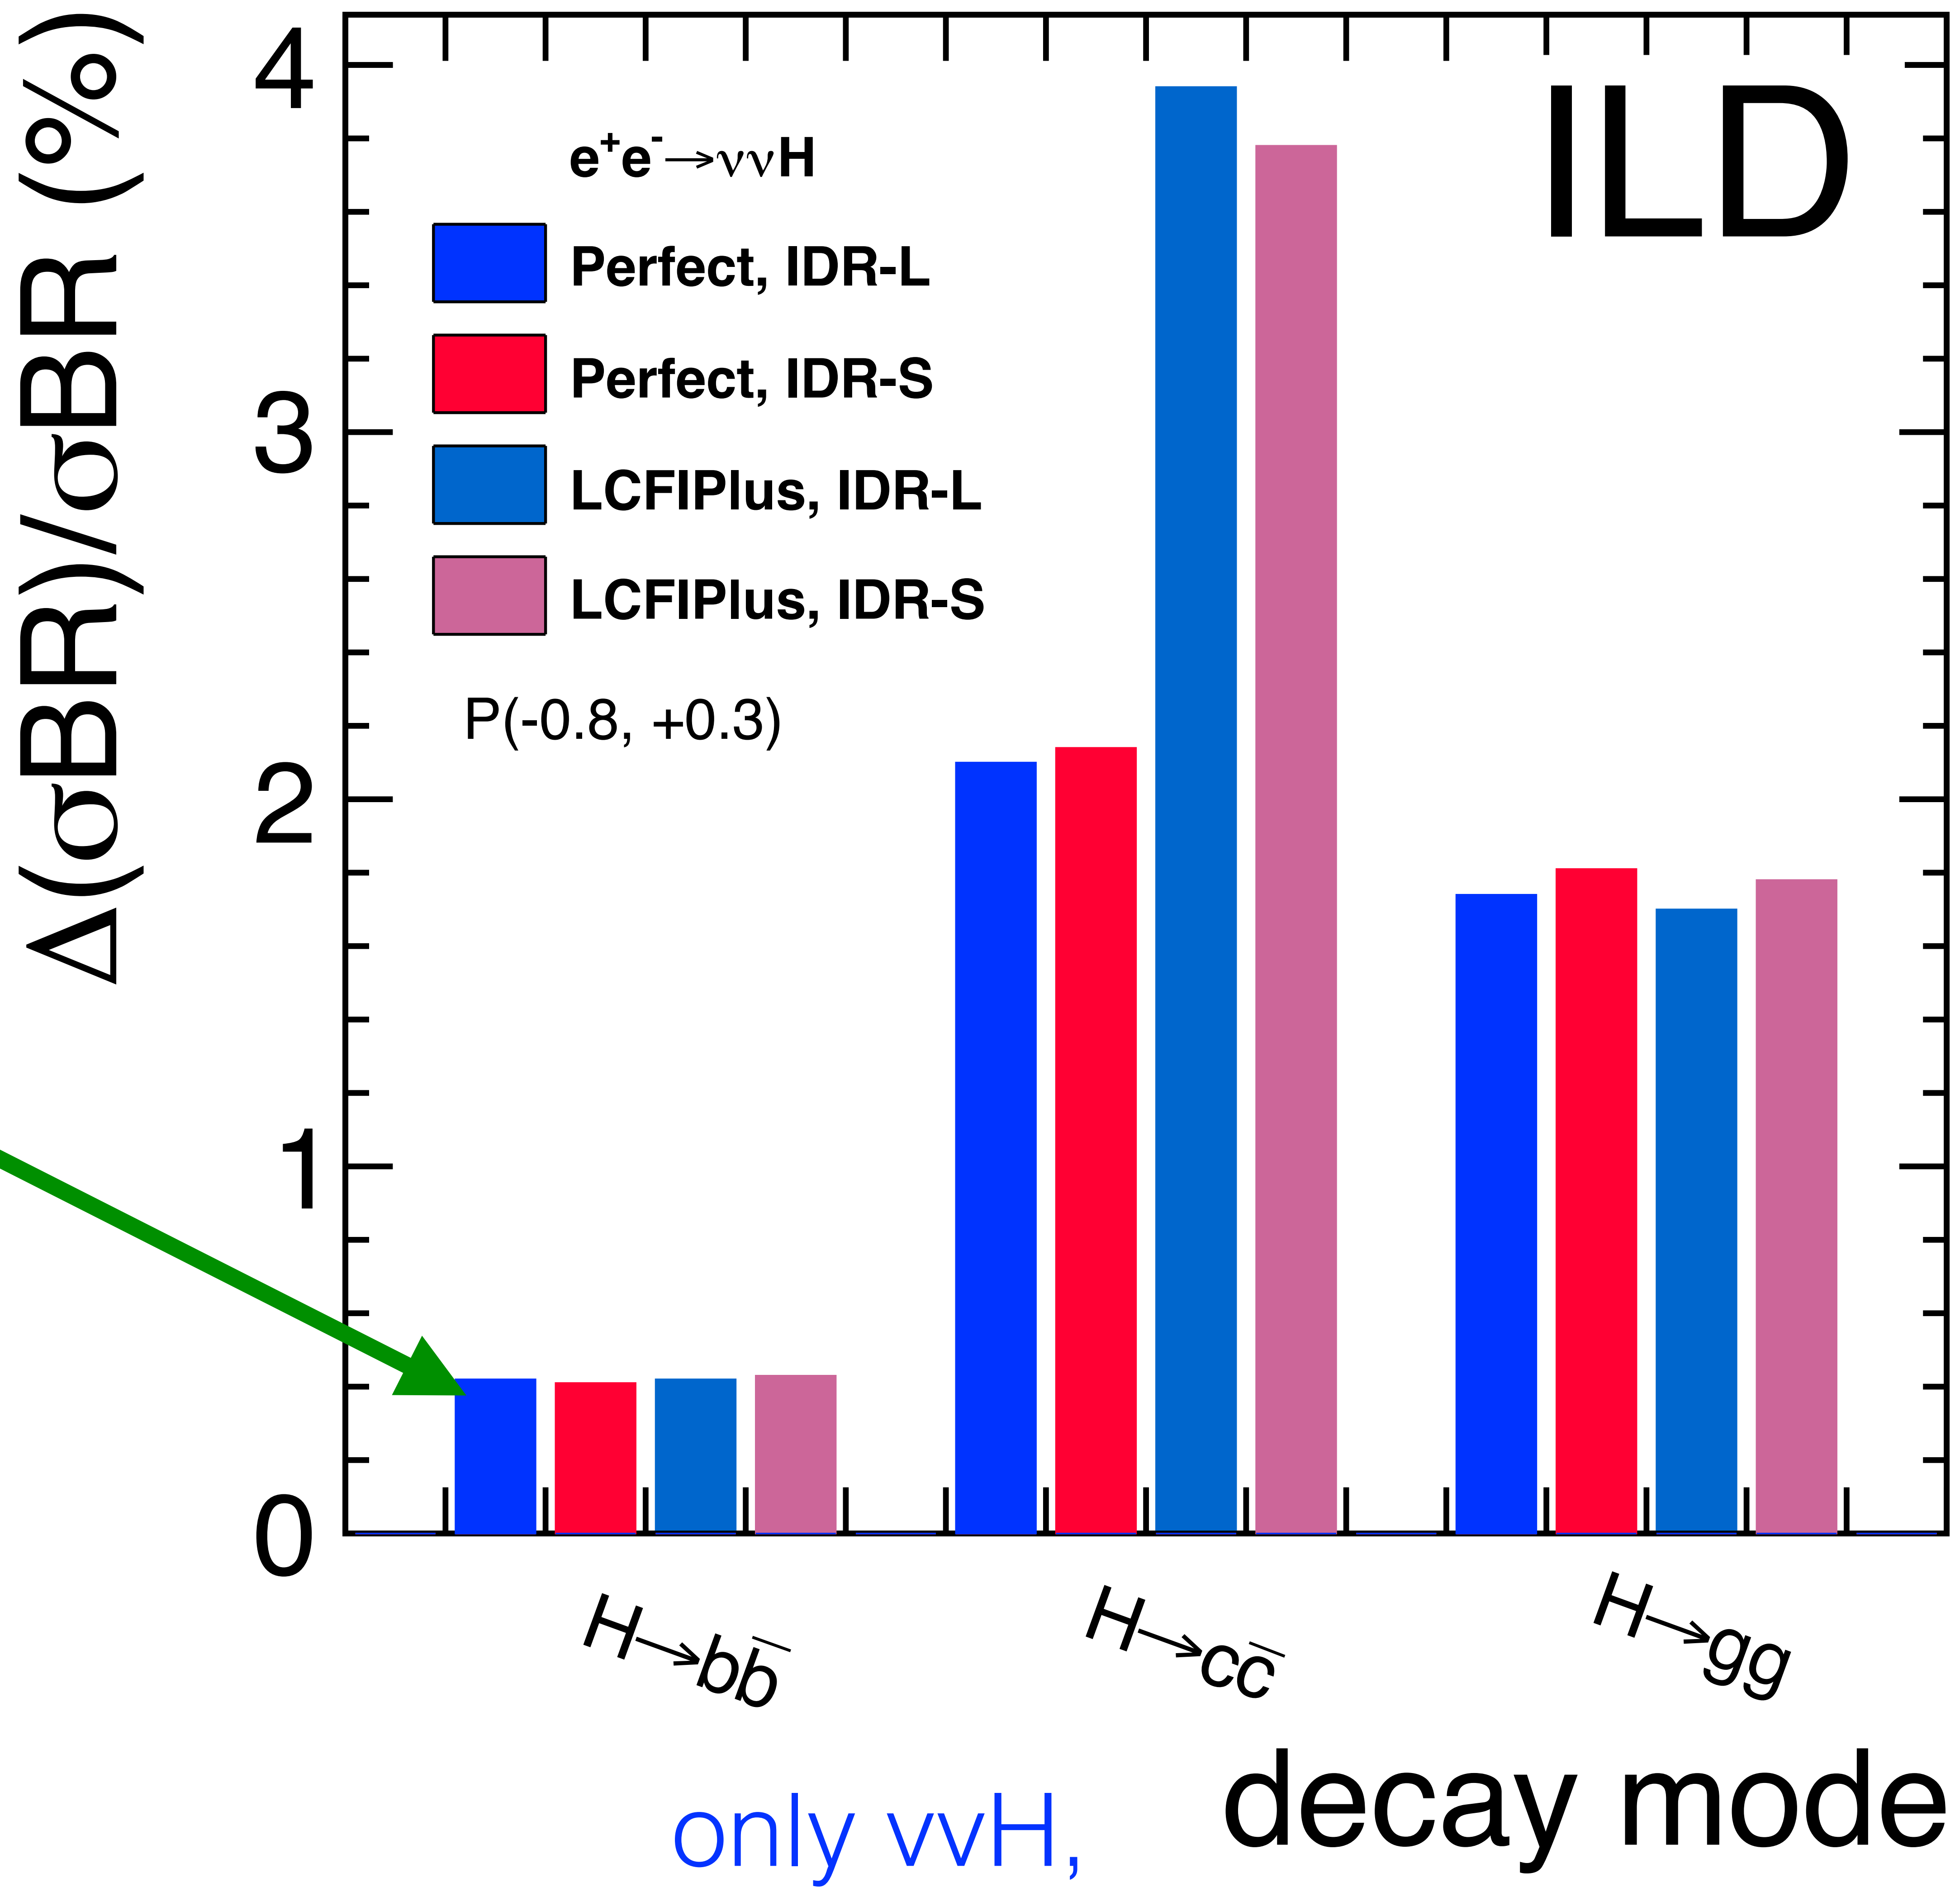
Higgs decay to bb/cc/gg

…the experimental situation

- use all visible decay modes of Z and ννH
- H->jets and Z->jets play important role!
- Example from ILD IDR:
  - **σxBR(bb) to ~0.4%** from one channel & data set alone
  - σxBR(cc) shows a lot (!) of room for improvement by smarter flavour tag algorithm

all channels / data sets





only ννH, 1.6ab-1 P(-0.8,+0.3) @ 500 GeV

Interesting momentum range
=> impact on ParticleFlow / Jet Energy Resolution?!

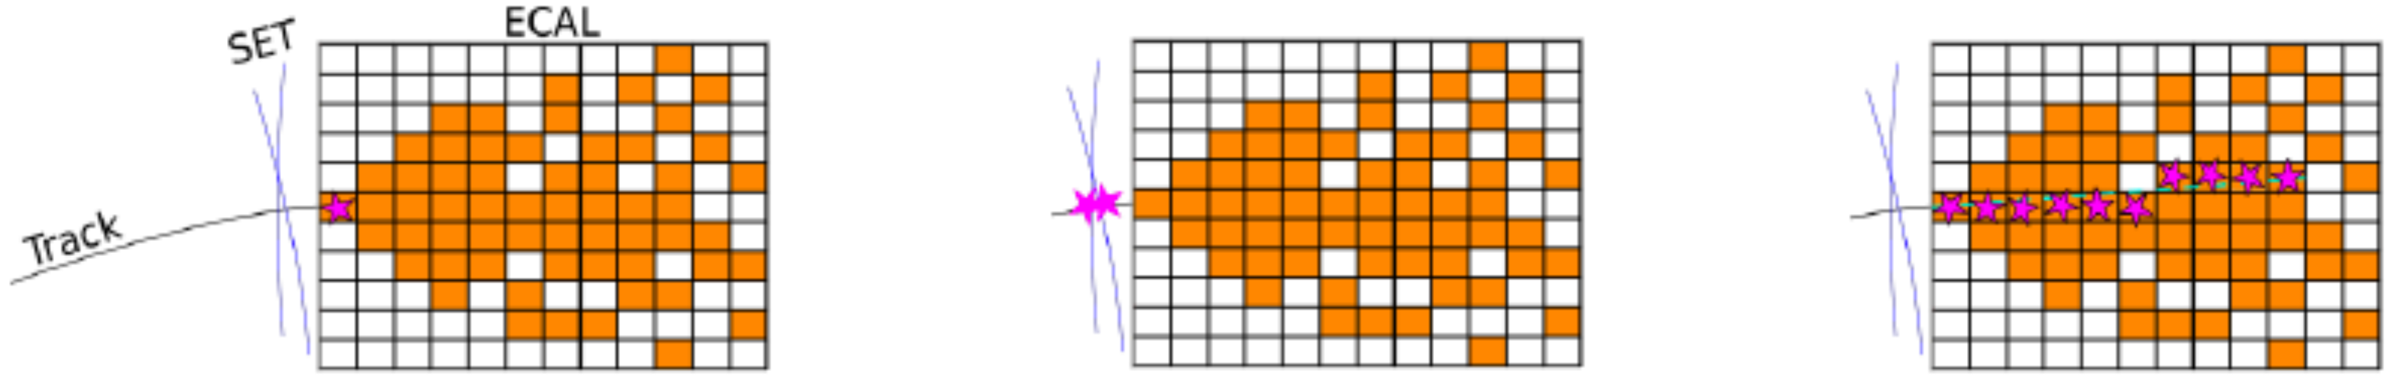
Various implementation options in Si tracking or ECal
=> use-case for low-momentum PID not yet understood

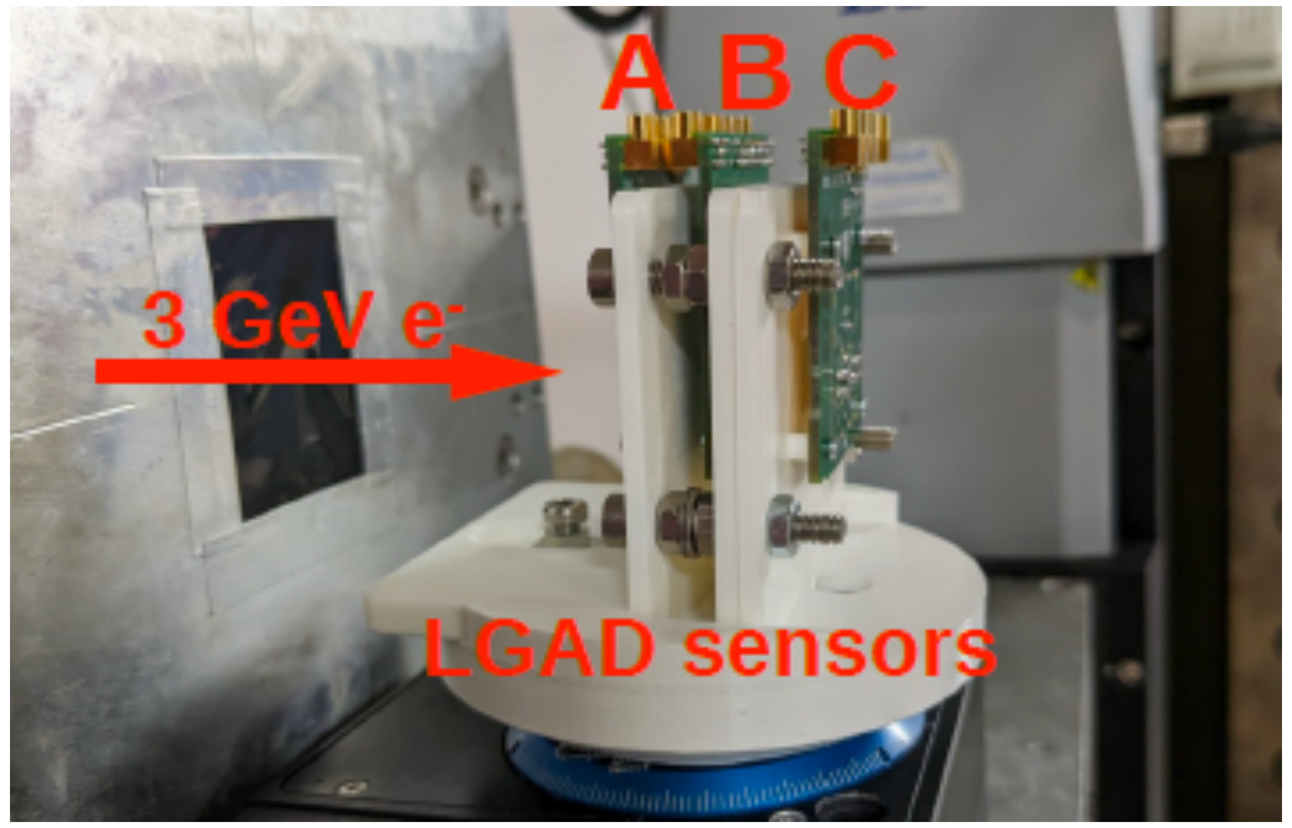
Fast Timing

not only PID!

Timing implementation in the ILD



Placement:	Dedicated ECAL timing layer (LGADs)	Two Si strips of external tracker (LGADs?)	10 ECAL layers (not LGADs)
Hit time resolution:	~ 30 ps	~ 50 ps	~ 100 ps
TOF resolution:	~ 30 ps	~ ? ps	~ ? ps

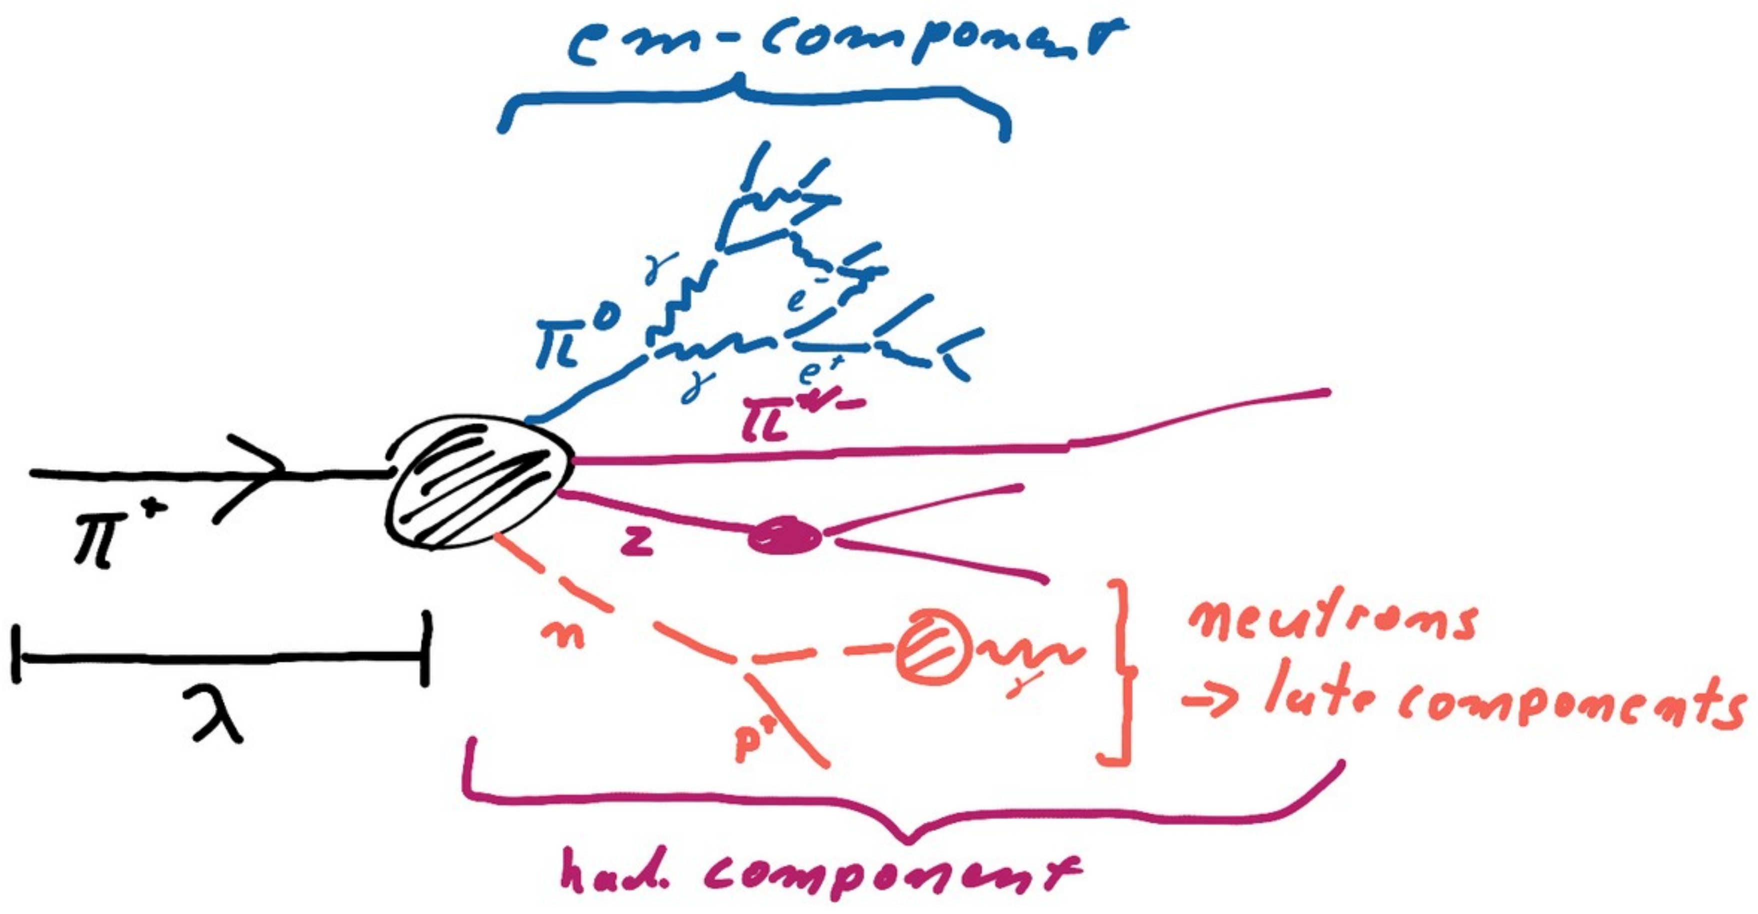


LGADs in the detector:
→ high power consumption
→ active cooling
→ space& material budget
→ not good

B.Dudar

Timing measurements for shower developments

- Neutral and slow components
  - Require ~ns precision
  - Reachable today with “standard” silicon, scintillators calorimeters
- ~0.1 ns scale: near the corner
- An even lower with GRPC (20ps)



A. Irles

These were just examples…

… there are many open questions

- **Existing ILC detector concepts are actively evaluating new technologies & design ideas - severely limited by person power!**
  - Strategy / plan document SiD: “Updating the SiD Detector concept,” arxiv: 2110.09965
  - Strategy / plan document ILD: “ILD Strategy“
  - Many open physics questions on ILC & Higgs factories in general: ILC Study Questions for Snowmass 2021

- **All Higgs factories are using the same software framework (Key4HEP):**
  - share algorthmic developments
  - share / exchange data sets for comparable analyses etc

=> anybody who’d like to shape the experiments of the next collider would be wise to build up expertise on Key4HEP *now*

Discovery Potential

Or: beware what LHC limits really mean!

- LHC does very well on probing some BSM phase space
- but beware that exclusion regions are extremely model-dependent, especially for electroweak new particles (eg charginos, staus, …)
- ILC study of full detector simulation for two benchmark points ☆☆ - motivated by leptogenesis & gravitino DM - and extrapolation to full plane
- conclusions:
  - loop-hole free discovery / exclusion potential up to ~ half E_{CM}
  - even in most challenging cases few % precision on masses, cross-sections etc
  - SUSY parameter determination, cross-check with cosmology

Discovery Potential

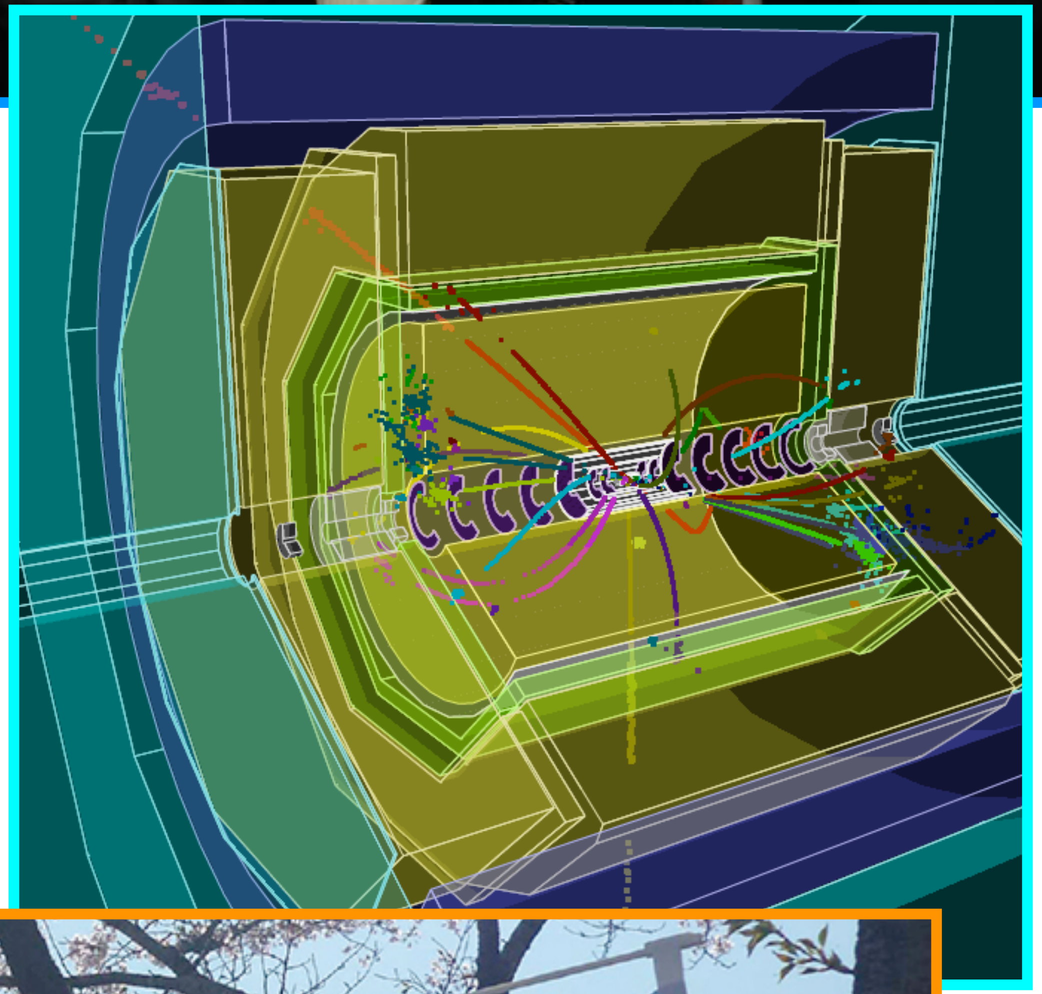
Conclusions

and outlook

- The discovery of the Higgs boson has provided a new messenger from the early universe
  => an e+e- Higgs factory will let this messenger speak to us!
- Several e+e- projects have been proposed
  - All provide similar performance for exploring single-Higgs production at E_{CM} = ~250 GeV
  - Only linear colliders like ILC are upgradable to higher energies ≥ 500 GeV for complete exploration of the Higgs (self-coupling!)
  - resources / sustainability will play a significant role
- The ILC is just NOW starting into a new phase, the ILC Technology Network, in which laboratories around the world will team up to advance the R&D, and work towards an engineering design - and a scientific and political consensus
- Many open questions also on detector side - and final choices will depend crucially on modern reconstruction algorithms
  => a lot to learn from LHC, Belle-II etc & a lot room for new developments



Join the Team!

How to contribute

- **want to get involved?**
  - **ECFA set up a workshop series on Physics, Experiments and Detectors at a Higgs, Top and Electroweak factory cf https://indico.cern.ch/event/1044297/**
    - main goals:
      - address topics in common between all e^+e^- colliders, i.e. theory prediction, assessment of systematic uncertainties, software tools
      - trigger joint work across e+e- collider projects
      - will give important input to next update of European Strategy
    - **if you don't won't to commit to a specific collider project / detector concept => this is your way to contribute => get in touch!**
  - **Project specific, eg detector specific questions -> contact e.g. ILC:**
    - ILC Study Questions: arXiv:2007.03650
    - sign-up for the topical group mailing lists: https://agenda.linearcollider.org/event/9154/
- **In either case, you're welcome to drop me an email: jenny.list@desy.de**

Backup

And what if Japan doesn’t host the ILC?

A Linear Facility in Europe or the US?

- **many other Linear Collider technologies / ideas**
  - CLIC
  - C3, HELEN, ReLiC, …. plasma collider???
- **should we as particle physicists care which technology is used in the accelerator?**
  - well, it should work, and soon: alll other technologies than SCRF much less tested!
- **What we really care about (determines the physics program):**
  - luminosity “L”
  - center-of-mass energy range “E”
  - beam polarisation “P”
- **What we partially care about (constrains the detector design):**
  - accelerator background consitions
  - time structure of accelerator
- **What we need to care about**
  - resources: money, CO2, rare earths, …
  - for both construction and operation

And what if Japan doesn’t host the ILC?

A Linear Facility in Europe or the US?

- **many other Linear Collider technologies / ideas**
  - CLIC
  - C3, H
- **should w**
  - well, it
- **What we**
  - lumino
  - cente
  - beam
- **What we**
  - accele
  - time s
- **What we**
  - resou
  - for both construction and operation

Develop concept for a Linear Facility, for Europe or US ?
- starting with ILC technology
- foreseeing later upgrades to other technologies
- plus a rich program of extra beamlines

Problem: US is busy with DUNE, CERN with HL-LHC
- Japan still could start faster with a Higgs factory
- but time is runnning out….

Crucial:
- outcome of P5 process in the US (~Oct 2023)
- success of ITN to trigger inter-governmental discussions
- outcome of FCC feasibility study *and* submissions for next update of European strategy ~2025

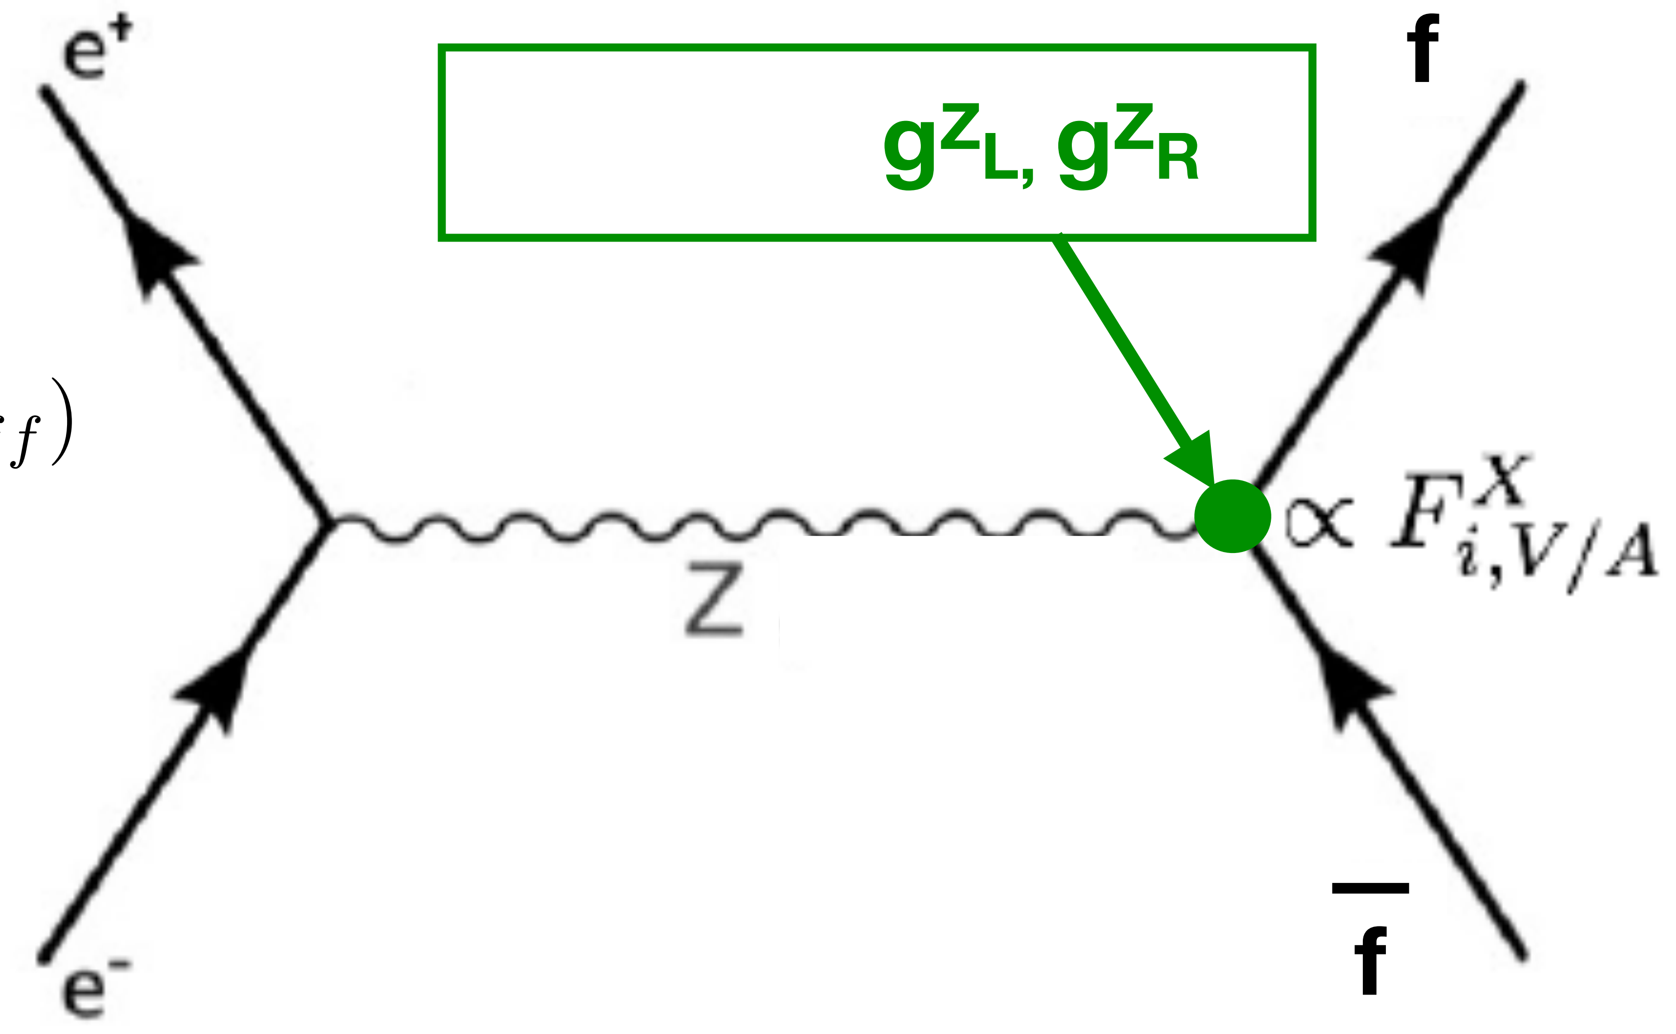
Polarisation & Electroweak Physics

let's first recall at the Z pole situation

g_{Lf}, g_{Rf} : helicity-dependent couplings of Z to fermions - at the Z pole:

=> $$A_f = \frac{g_{Lf}^2 - g_{Rf}^2}{g_{Lf}^2 + g_{Rf}^2}$$

specifically for the electron: $A_e = \frac{(\frac{1}{2} - \sin^2\theta_{eff})^2 - (\sin^2\theta_{eff})^2}{(\frac{1}{2} - \sin^2\theta_{eff})^2 + (\sin^2\theta_{eff})^2} \approx 8(\frac{1}{4} - \sin^2\theta_{eff})$



at an *un*polarised collider:

$$A^f_{FB} \equiv \frac{(\sigma_F - \sigma_B)}{(\sigma_F + \sigma_B)} = \frac{3}{4} A_e A_f$$

=> no direct access to A_e, only via tau polarisation

While at a ***polarised*** collider:

$$A_e = A_{LR} \equiv \frac{\sigma_L - \sigma_R}{(\sigma_L + \sigma_R)}$$ and $$A^f_{FB,LR} \equiv \frac{(\sigma_F - \sigma_B)_L - (\sigma_F - \sigma_B)_R}{(\sigma_F + \sigma_B)_L + (\sigma_F + \sigma_B)_R} = \frac{3}{4} A_f$$

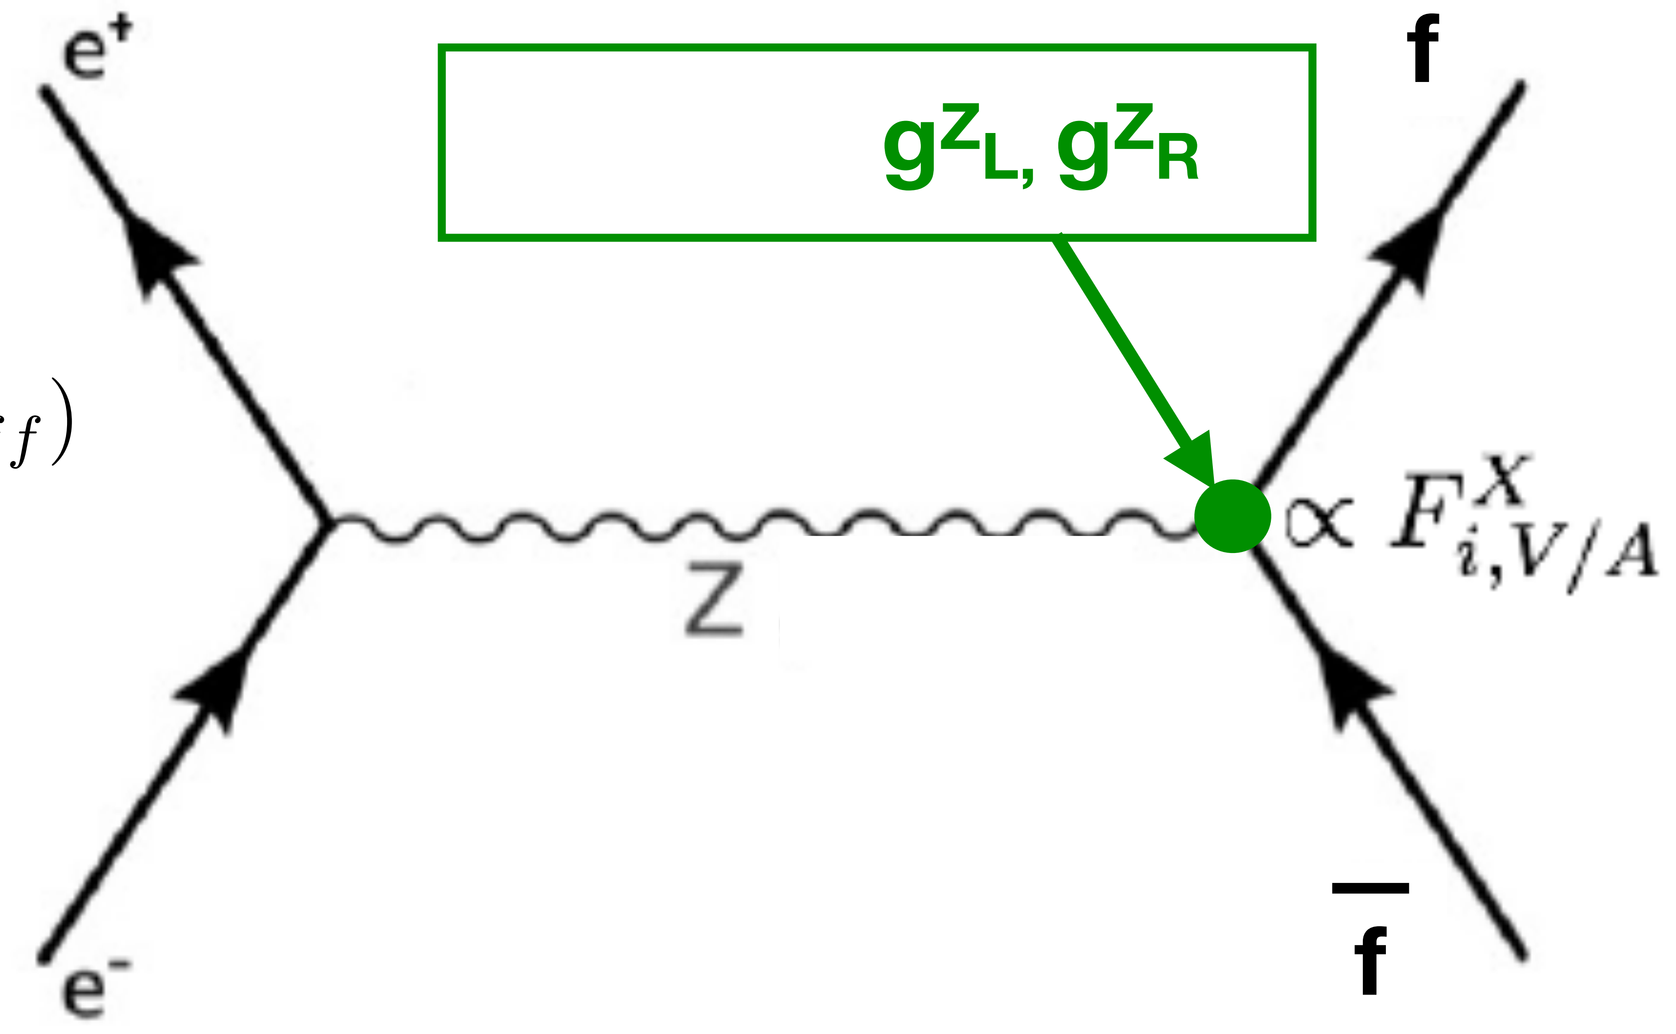
Polarisation & Electroweak Physics

let's first recall at the Z pole situation

g_{Lf}, g_{Rf} : helicity-dependent couplings of Z to fermions - at the Z pole:

=> $$A_f = \frac{g_{Lf}^2 - g_{Rf}^2}{g_{Lf}^2 + g_{Rf}^2}$$

specifically for the electron: $$A_e = \frac{(\frac{1}{2} - \sin^2\theta_{eff})^2 - (\sin^2\theta_{eff})^2}{(\frac{1}{2} - \sin^2\theta_{eff})^2 + (\sin^2\theta_{eff})^2} \approx 8(\frac{1}{4} - \sin^2\theta_{eff})$$



at an *un*polarised collider:

$$A^f_{FB} \equiv \frac{(\sigma_F - \sigma_B)}{(\sigma_F + \sigma_B)} = \frac{3}{4} A_e A_f$$

=> no direct access to A_e, only via tau polarisation

While at a ***polarised*** collider:

$$A_e = A_{LR} \equiv \frac{\sigma_L - \sigma_R}{(\sigma_L + \sigma_R)}$$ and $$A^f_{FB,LR} \equiv \frac{(\sigma_F - \sigma_B)_L - (\sigma_F - \sigma_B)_R}{(\sigma_F + \sigma_B)_L + (\sigma_F + \sigma_B)_R} = \frac{3}{4} A_f$$

trading theory uncertainy:

the **polarised** $A^f_{FB,LR}$ receives **7 x smaller radiative corrections** than the **unpolarised** A^f_{FB} !

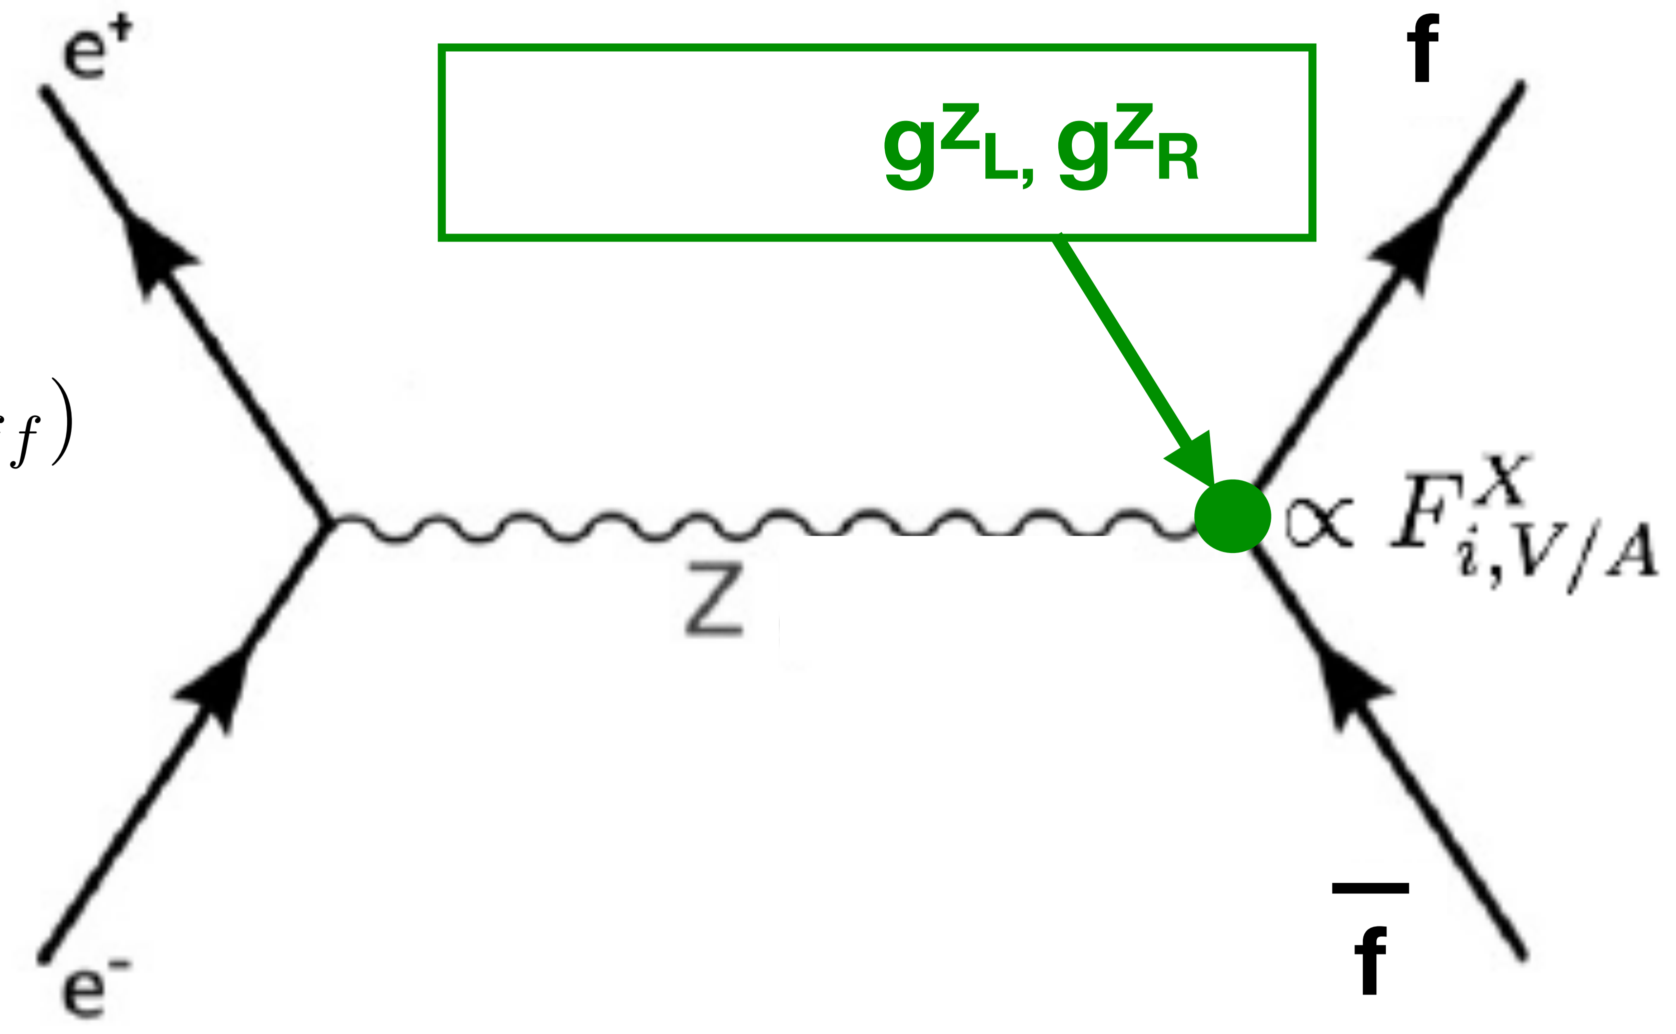
Polarisation & Electroweak Physics

let's first recall at the Z pole situation

g_{Lf}, g_{Rf} : helicity-dependent couplings of Z to fermions - at the Z pole:

=> $$A_f = \frac{g_{Lf}^2 - g_{Rf}^2}{g_{Lf}^2 + g_{Rf}^2}$$

specifically for the electron: $$A_e = \frac{(\frac{1}{2} - \sin^2\theta_{eff})^2 - (\sin^2\theta_{eff})^2}{(\frac{1}{2} - \sin^2\theta_{eff})^2 + (\sin^2\theta_{eff})^2} \approx 8(\frac{1}{4} - \sin^2\theta_{eff})$$



at an *un*polarised collider:

$$A^f_{FB} \equiv \frac{(\sigma_F - \sigma_B)}{(\sigma_F + \sigma_B)} = \frac{3}{4} A_e A_f$$

=> no direct access to A_e,
only via tau polarisation

trading theory uncertainy:

the **polarised** $A^f_{FB,LR}$ receives 7 x smaller radiative corrections than the **unpolarised** A^f_{FB} !

above Z pole, polarisation essential to disentangle Z / γ exchange in $e^+e^- \to$ ff

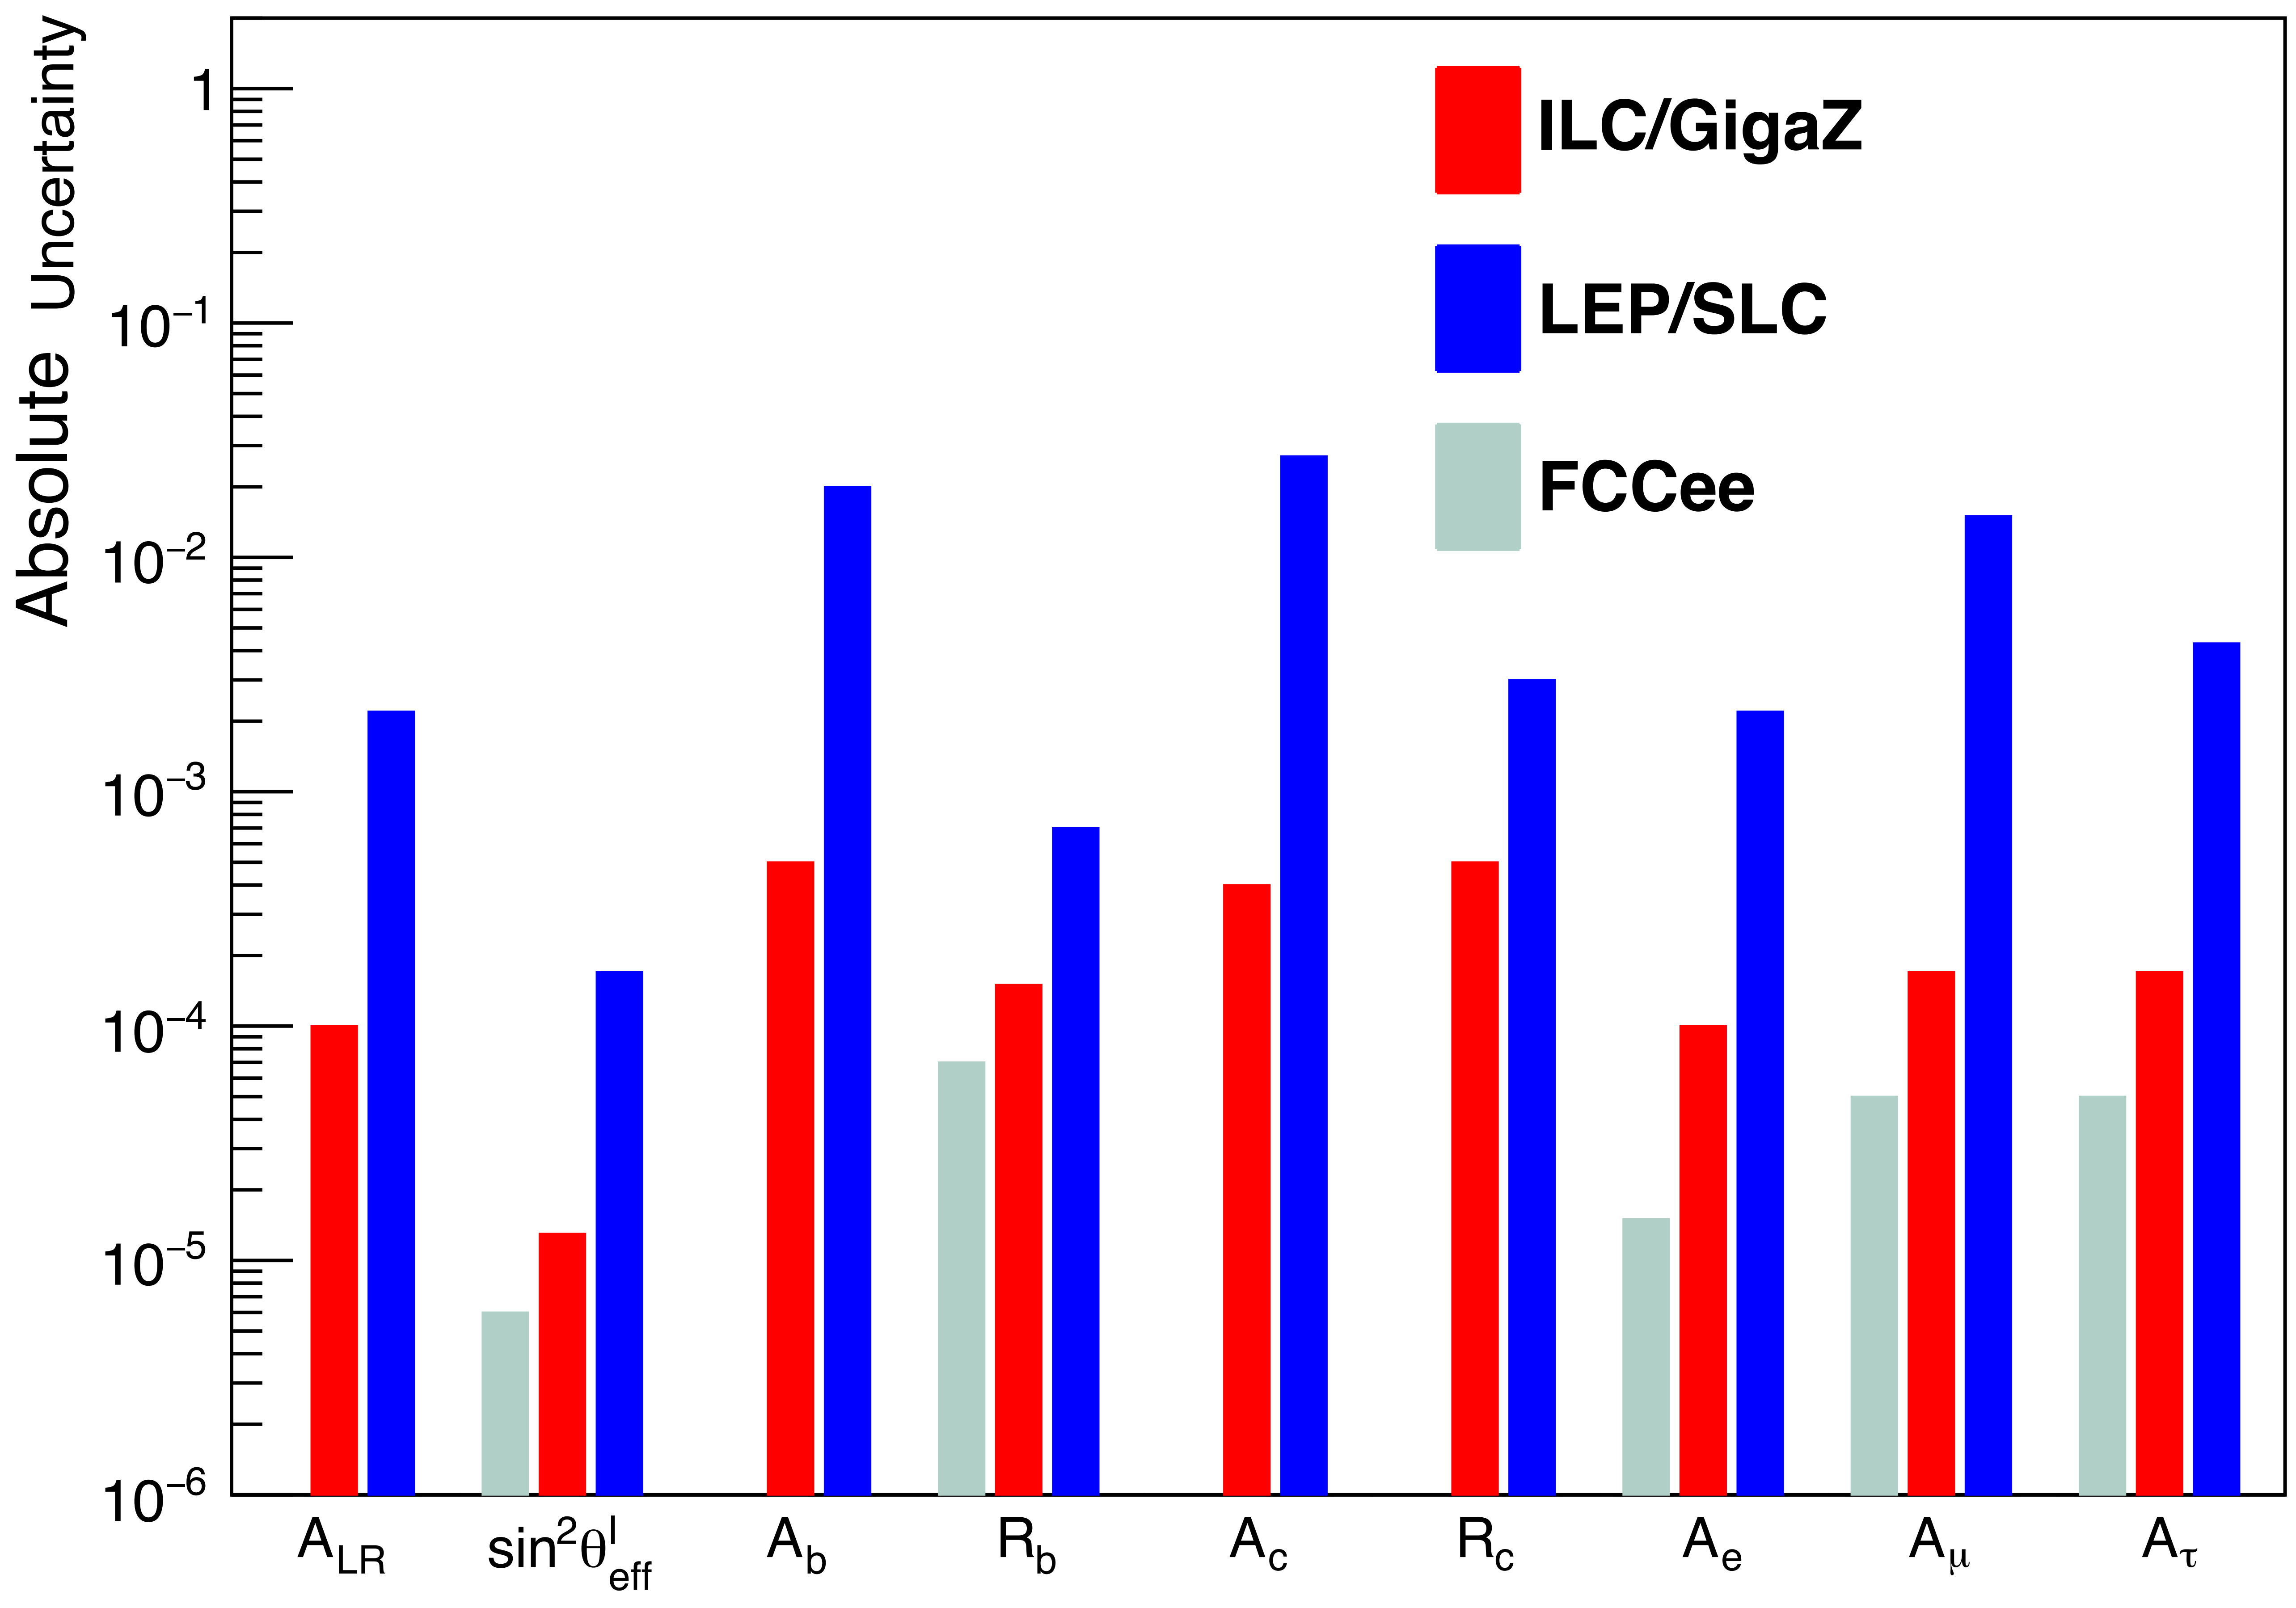
Polarisation & Electroweak Physics at the Z pole

LEP, ILC, FCCee

recent detailed studies by ILD@ILC:

- at least factor 10, often ~50 improvement over LEP/SLC
- note in particular:
  - **A_c nearly 100 x better** thanks to excellent charm / anti-charm tagging:
    - excellent vertex detector
    - tiny beam spot
    - Kaon-ID via dE/dx in ILD's TPC

polarised "GigaZ" typically only factor 2-3 less precise than FCCee's unpolarised *TeraZ*
=> polarisation buys
a factor of ~100 in luminosity



Note: not true for pure decay quantities!

arXiv:1908.11299

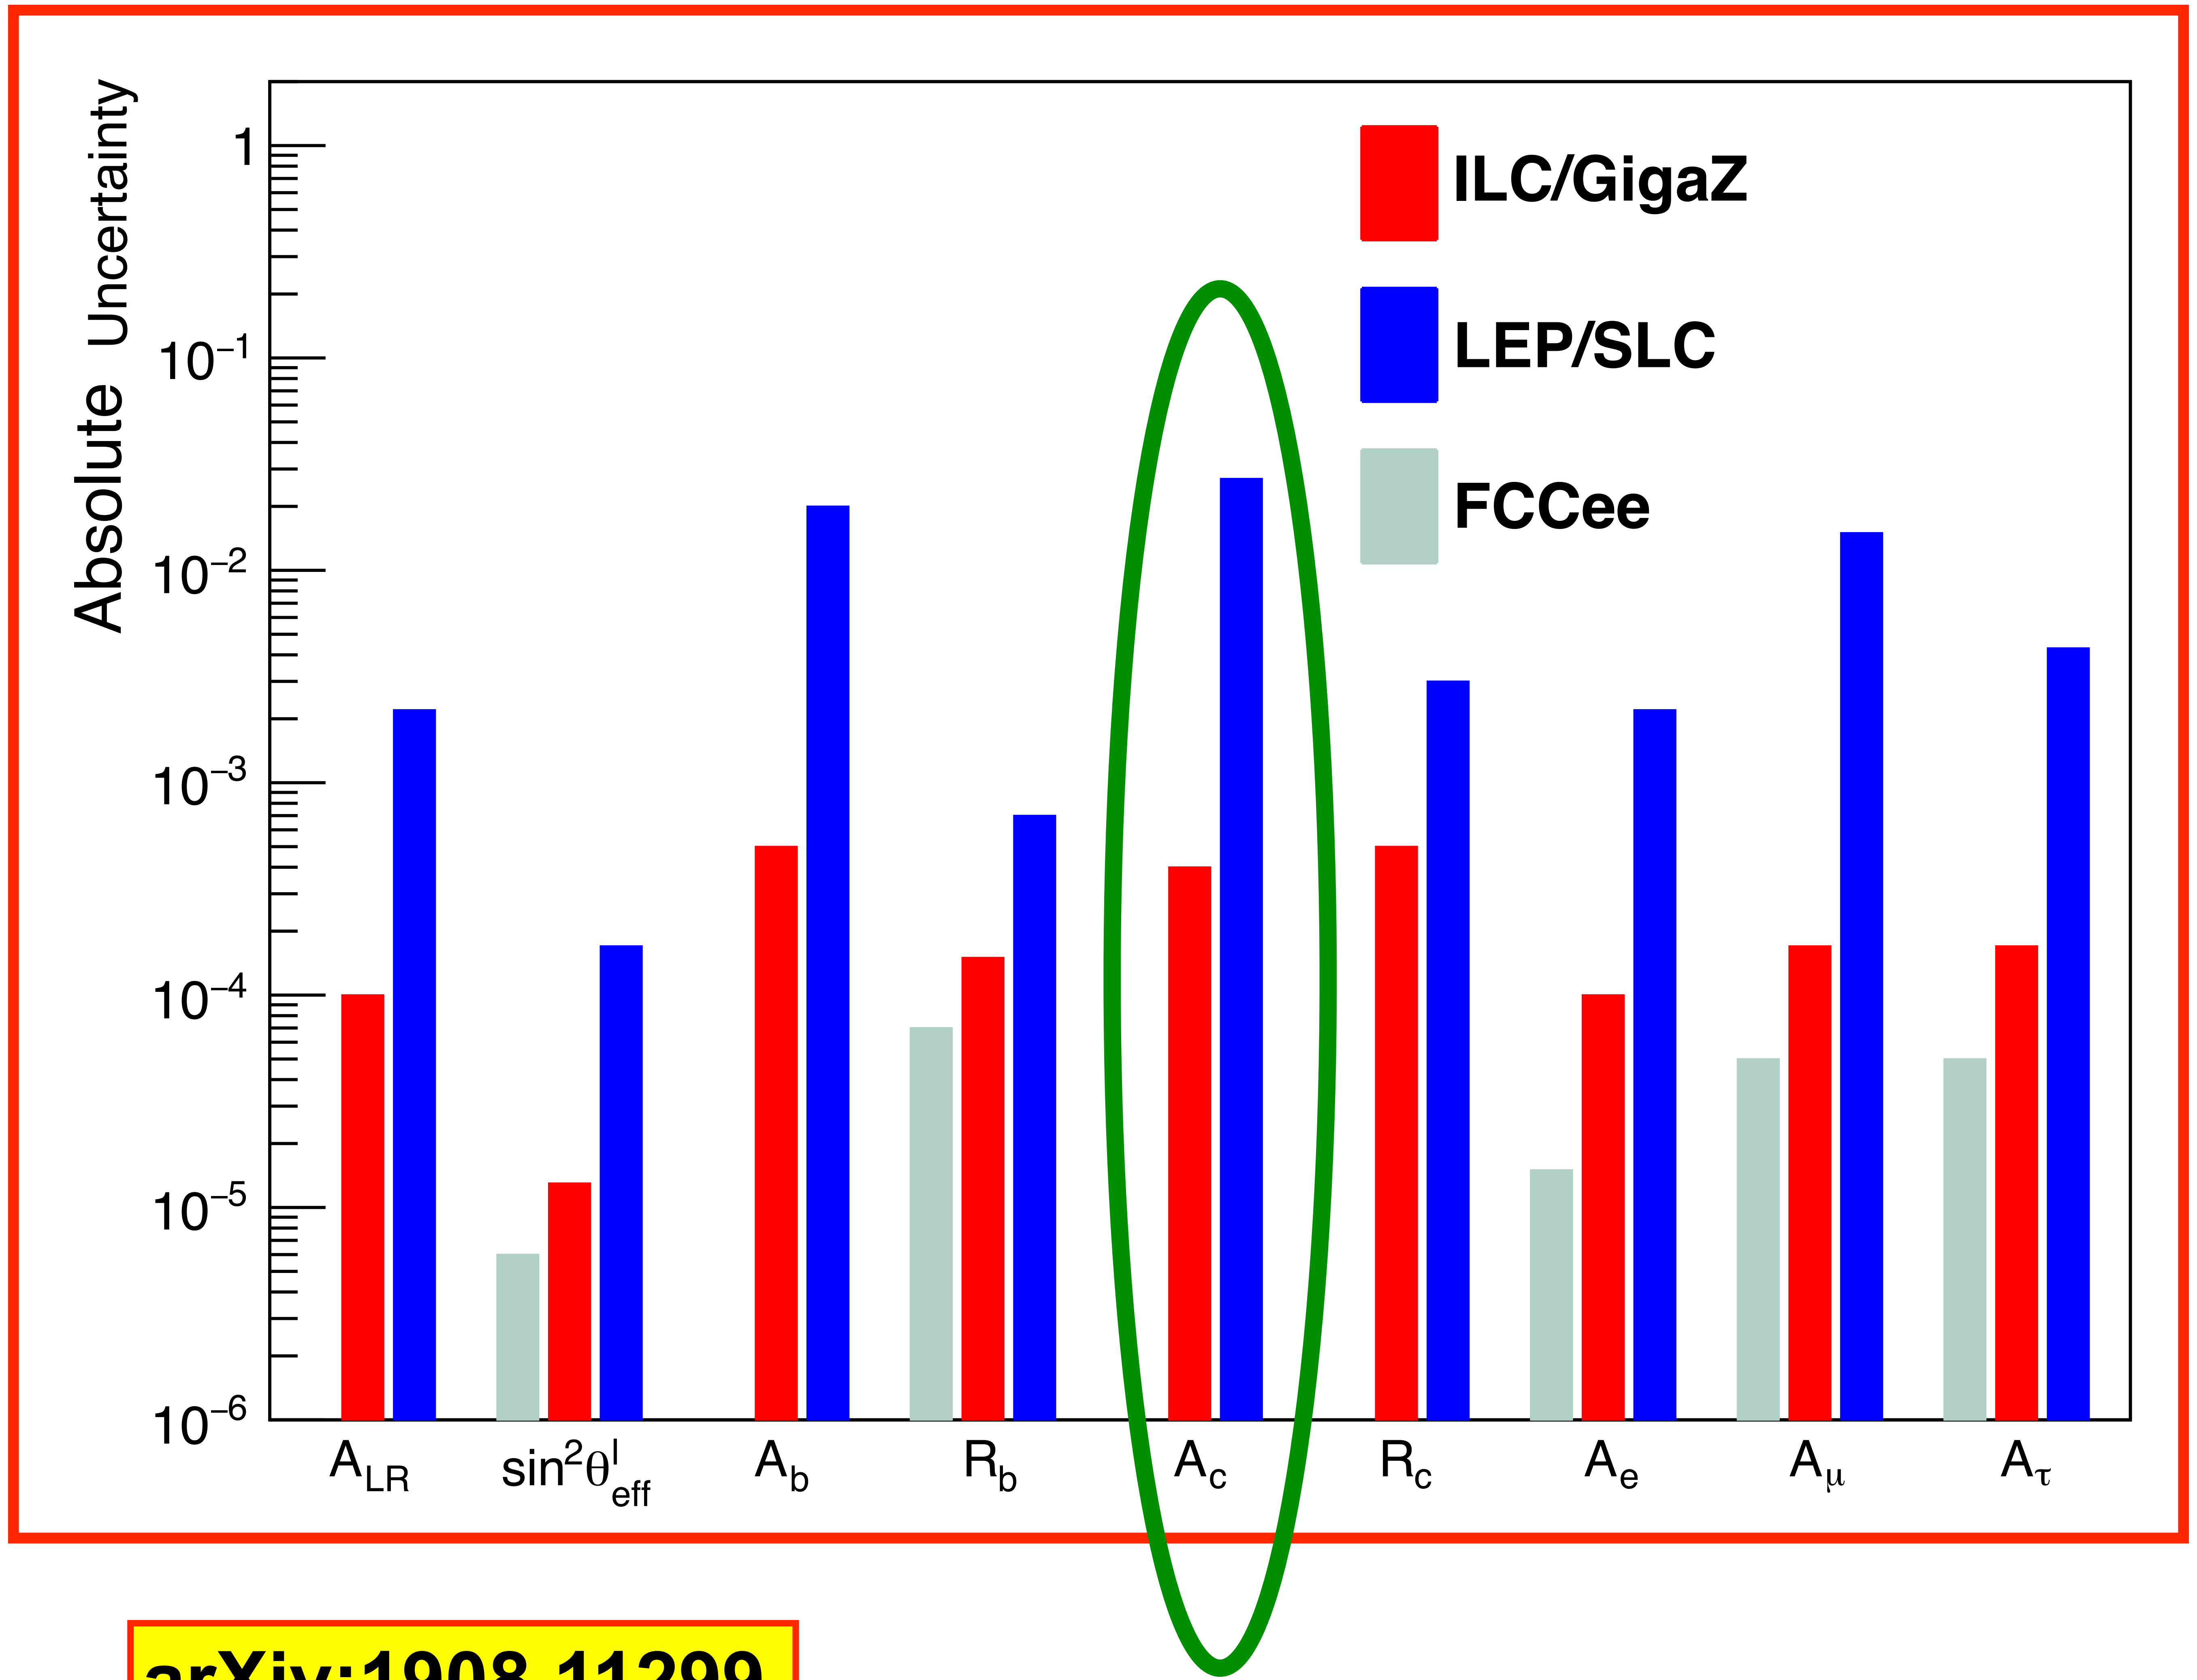
    - tiny beam spot
    - Kaon-ID via dE/dx in ILD's TPC

polarised "GigaZ" typically only factor 2-3 less precise than FCCee's unpolarised *TeraZ*
=> polarisation buys
a factor of ~100 in luminosity



Note: not true for pure decay quantities!

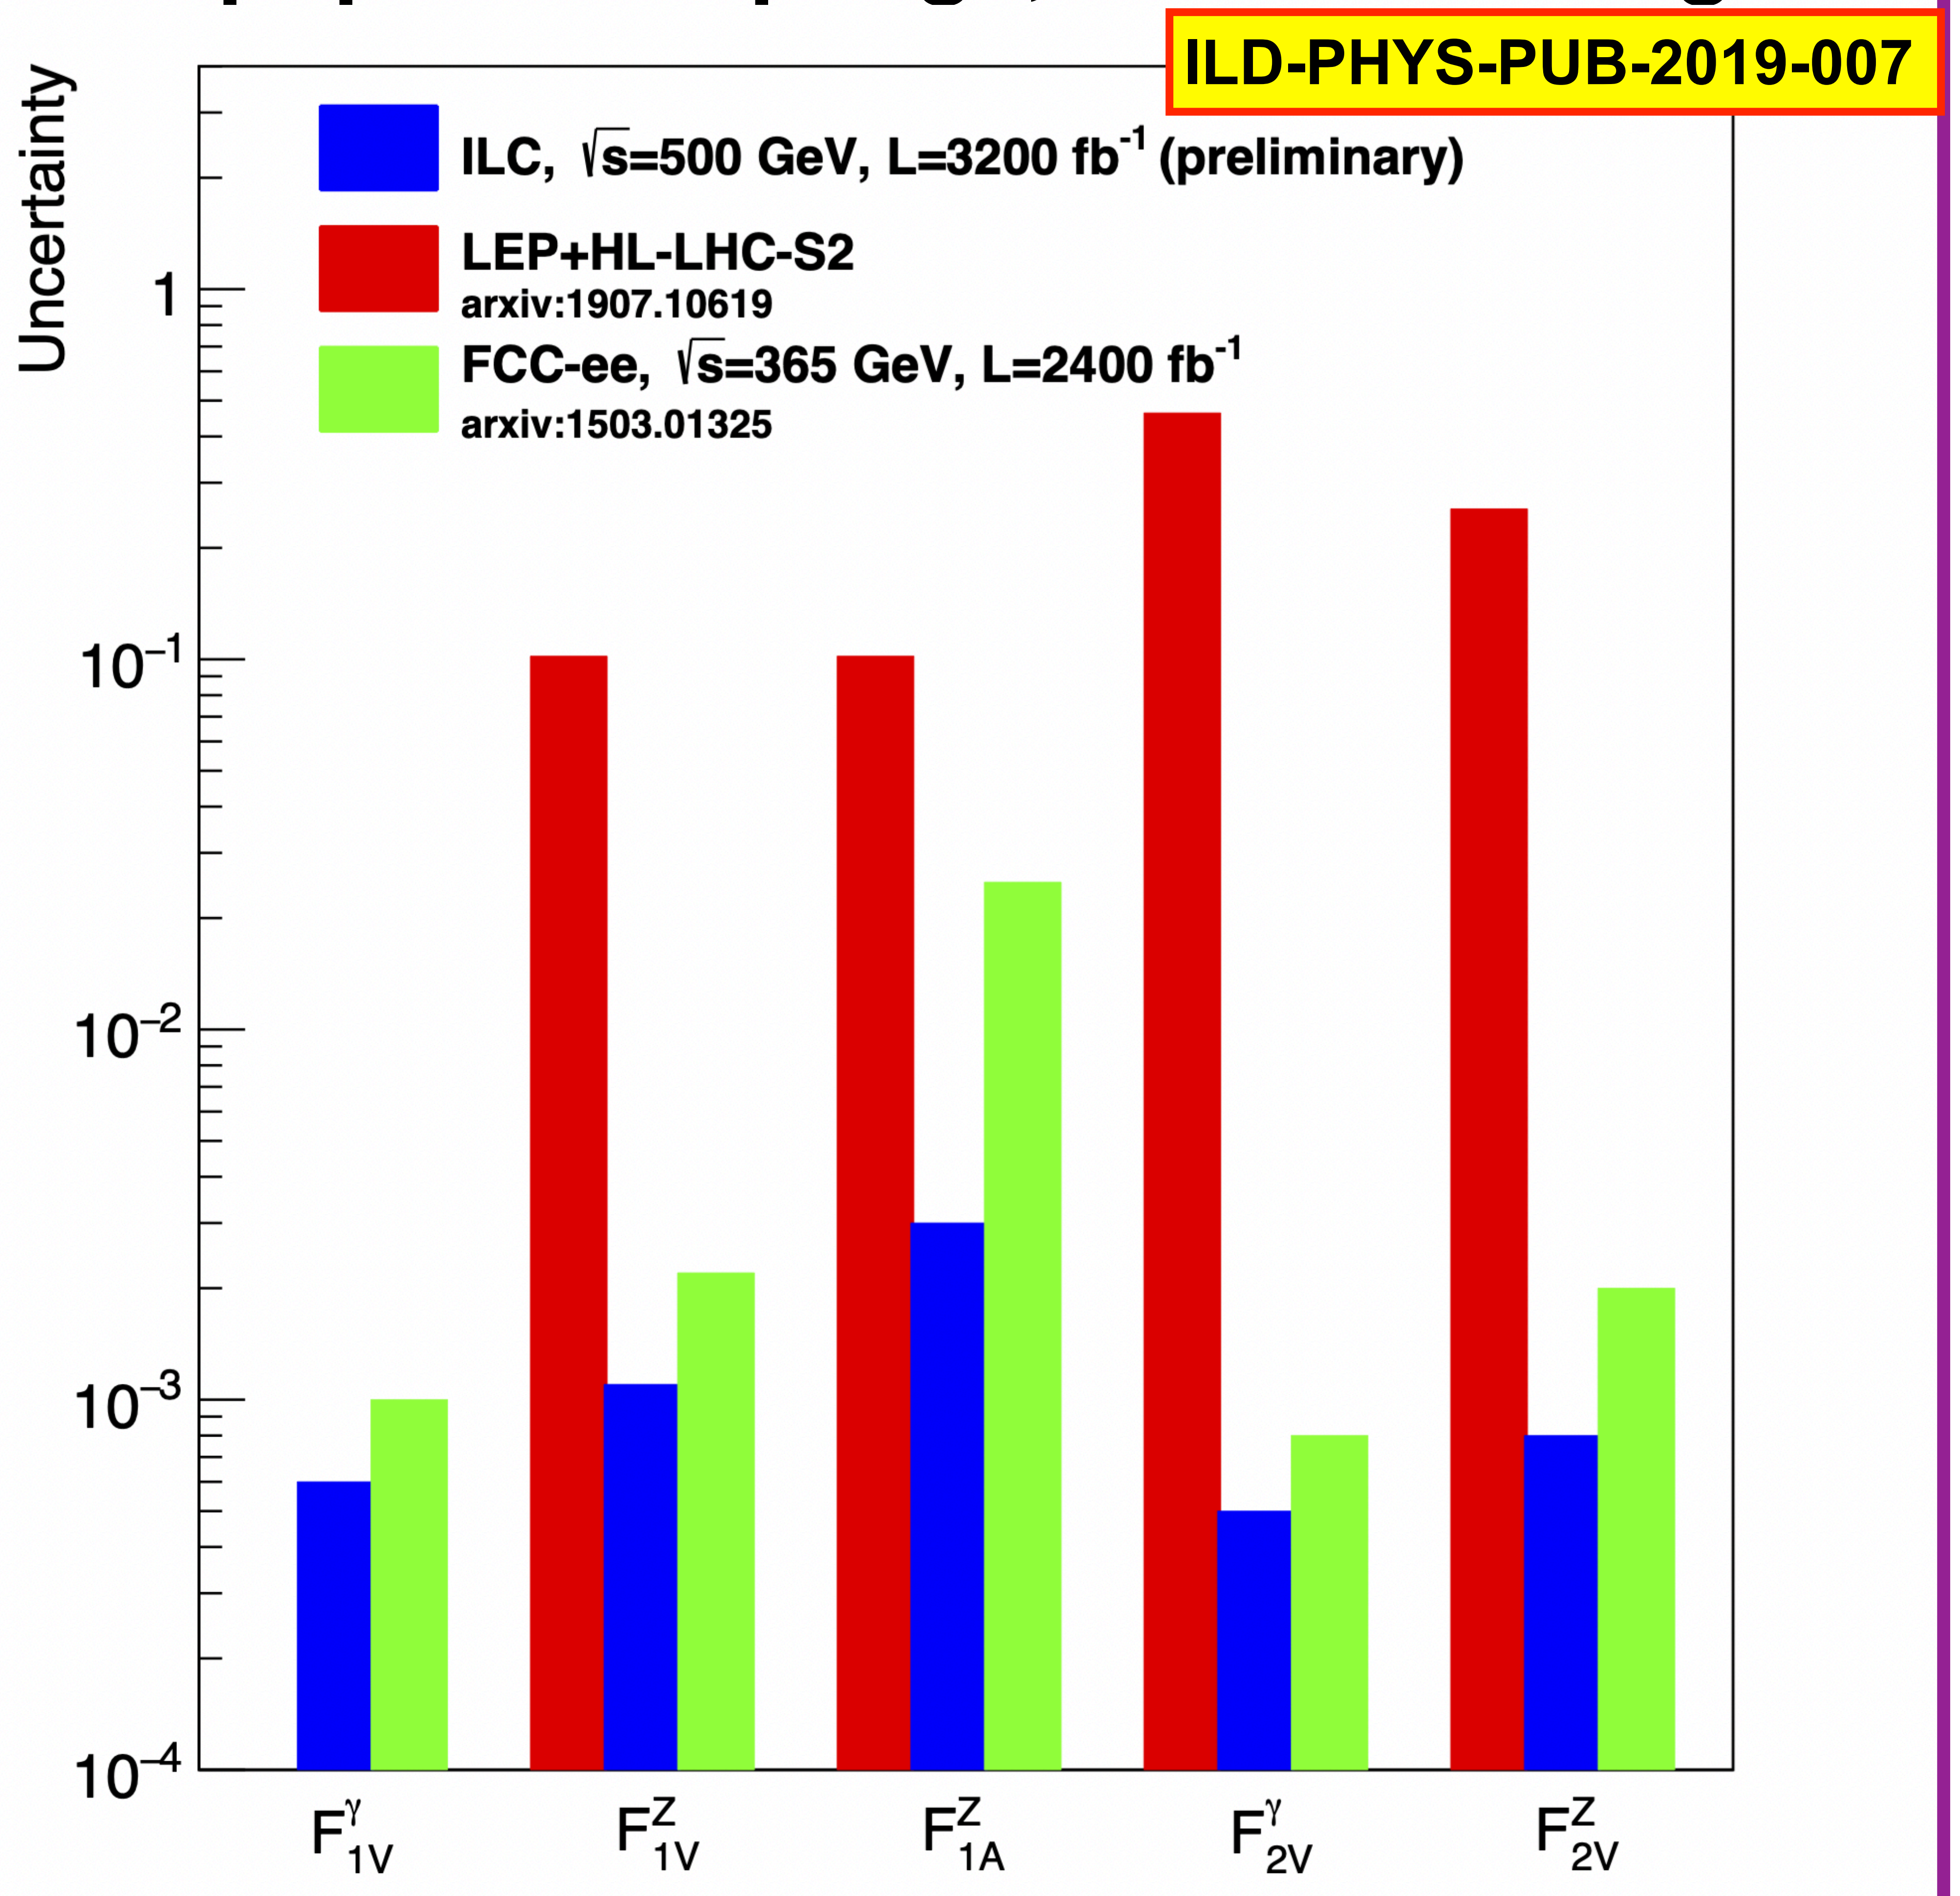
arXiv:1908.11299

Polarisation & Electroweak Physics at high energies

e+e- at 500 GeV and 1 TeV

- ex1: top quark pair production - disentangle Z / γ:
  - unpolarised case: from final-state analysis only
  - polarised case: direct access
    - final state analysis can be done in addition
    => redundancy, control of systematics
- ex2: oblique parameters for 4-fermion operators
  - beam polarisation essential to disentangle Y vs W
  - ILC 250 outperforms HL-LHC
  - ILC 500 outperforms unpolarised e^+e^- machines

top quark couplings, CP conserving



Polarisation & Electroweak Physics at high energies

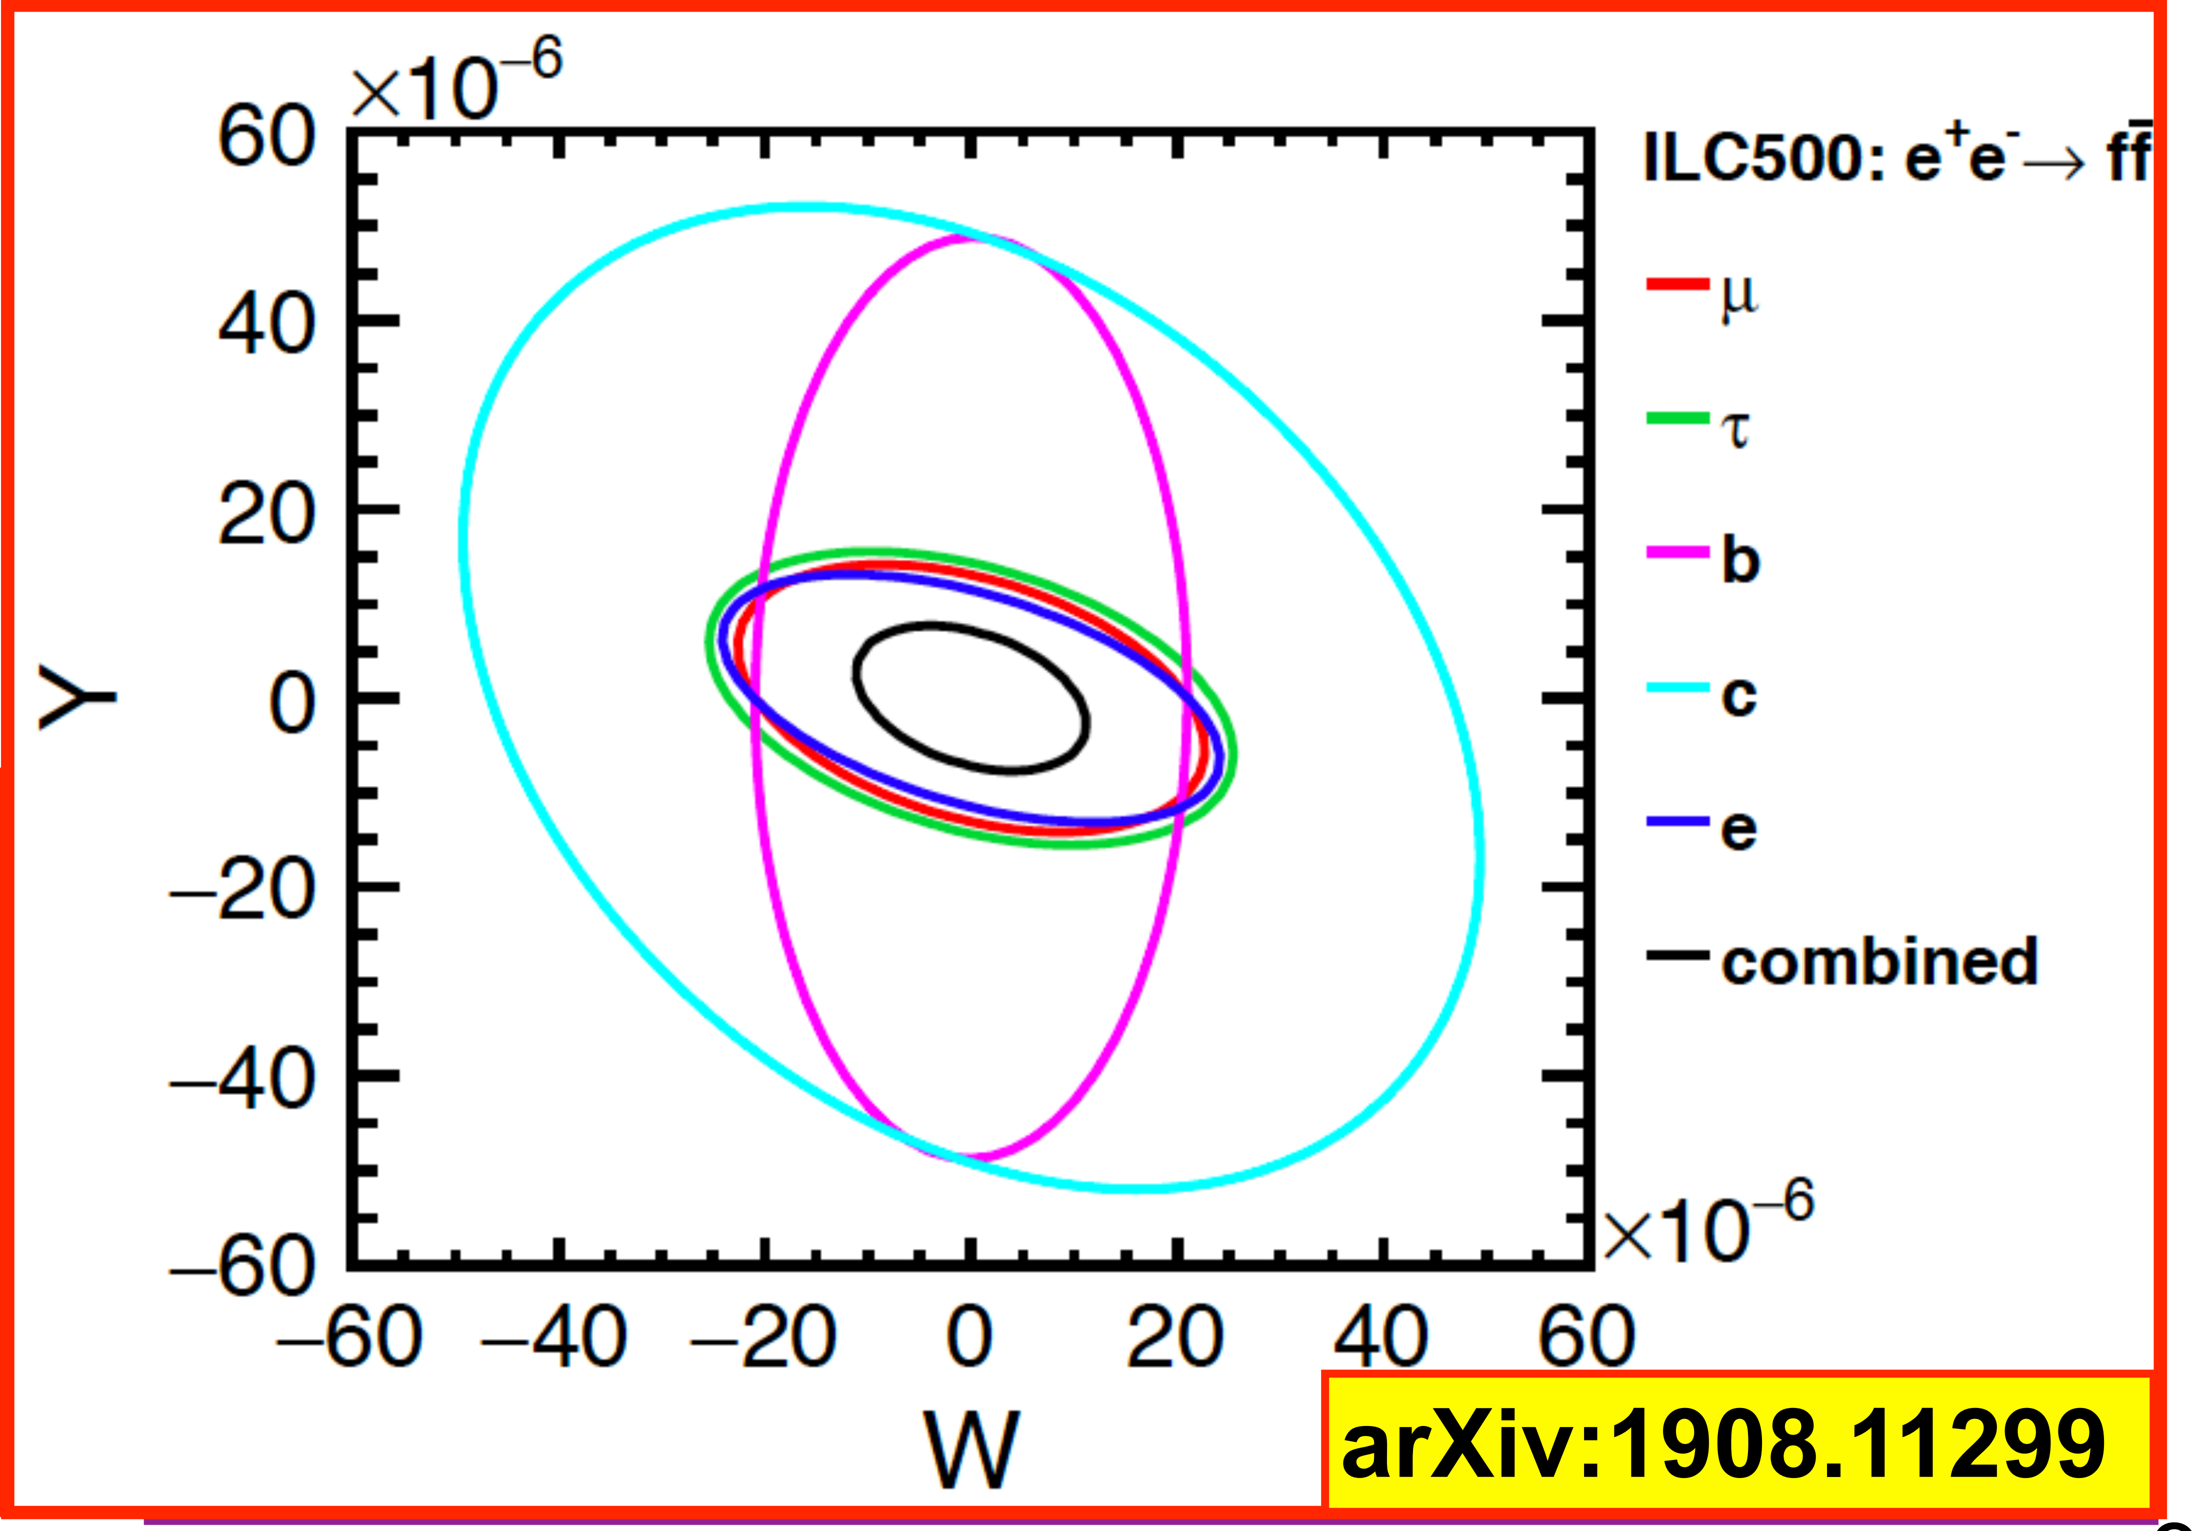
ILC1000	0.39×10^{-5}	0.27×10^{-5}	-0.38
500 GeV, no beam pol.	2.0×10^{-5}	1.2×10^{-5}	-0.78

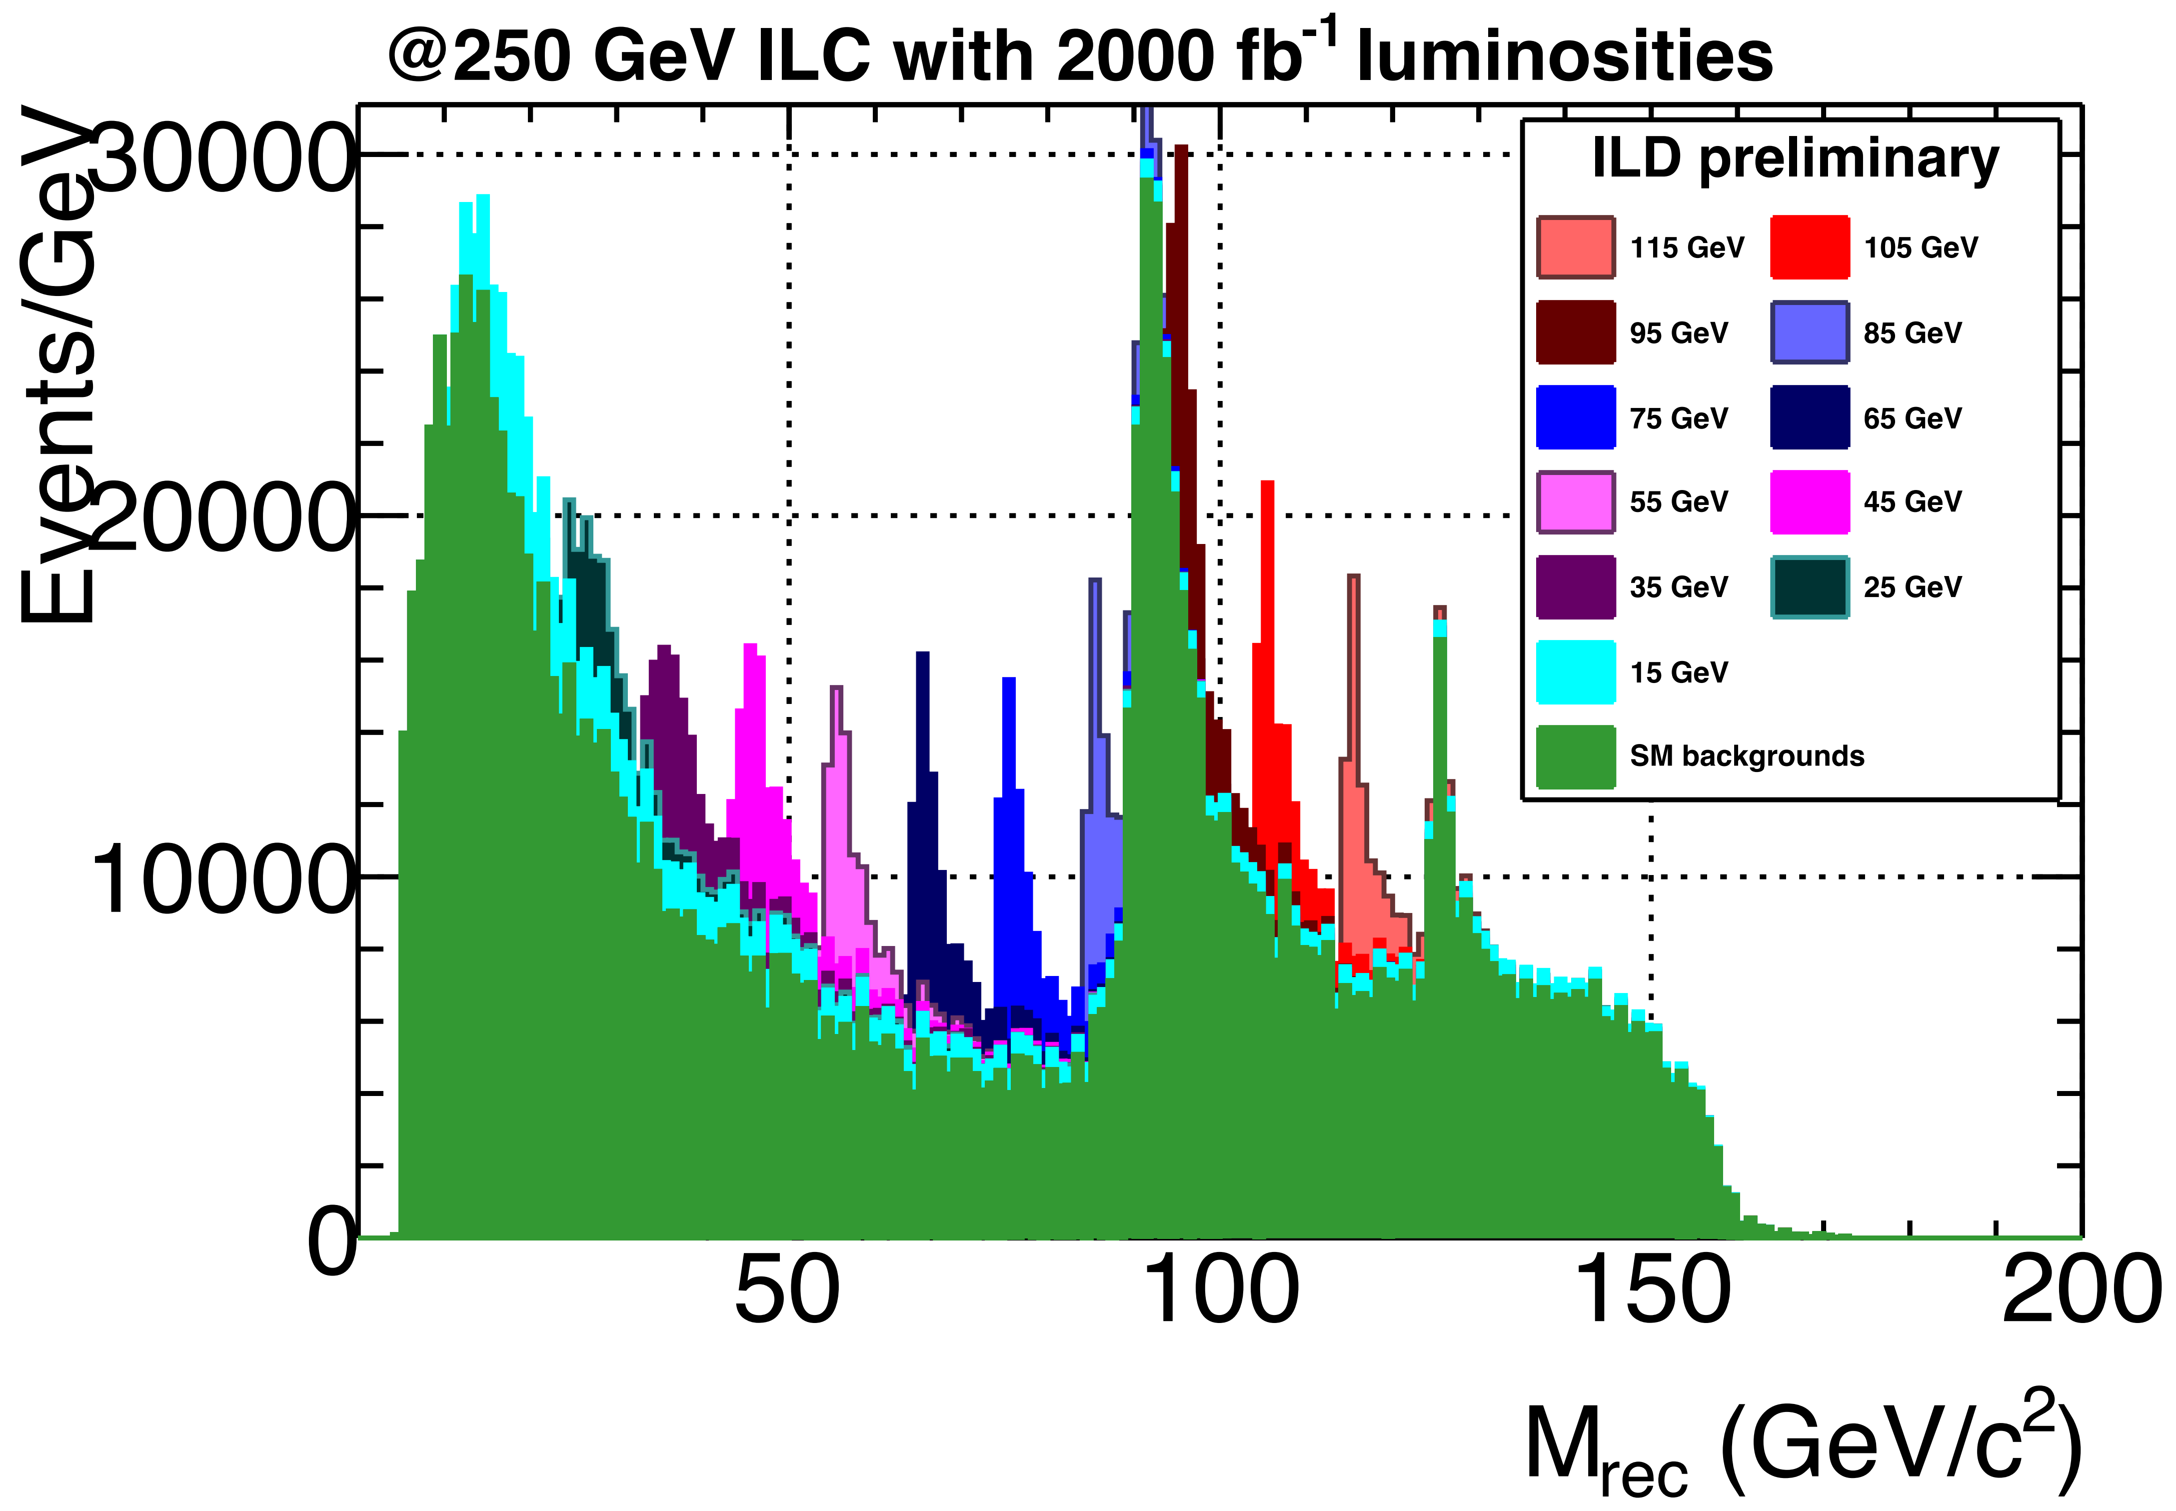


Extra Higgs Bosons ?

Siblings of the Higgs

- must “share” coupling to the Z with the 125-GeV guy:
  - $g_{HZZ}^2 + g_{hZZ}^2 \leq 1$
  - 250 GeV Higgs measurements: $g_{hZZ}^2 < 2.5\%\ g_{SM}^2$ excluded at 95% CL
- probe smaller couplings by ***recoil* of h against Z**

=> decay mode independent!



ILD full detector simulation @ ILC 250 GeV & 500 GeV, arxiv:2005.06265

★ **2 ab⁻¹ polarised ≈ 5 ab⁻¹ unpolarised**

★ **adding 500 GeV improves up to a factor of ~2**

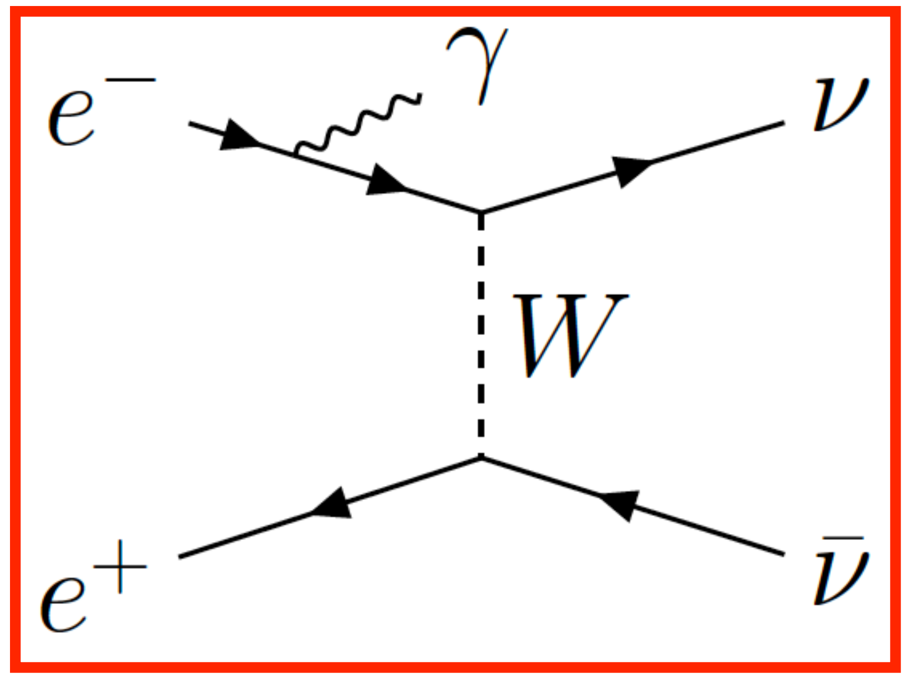
Physics benefits of polarised beams

General references on polarised e^+e^- physics:

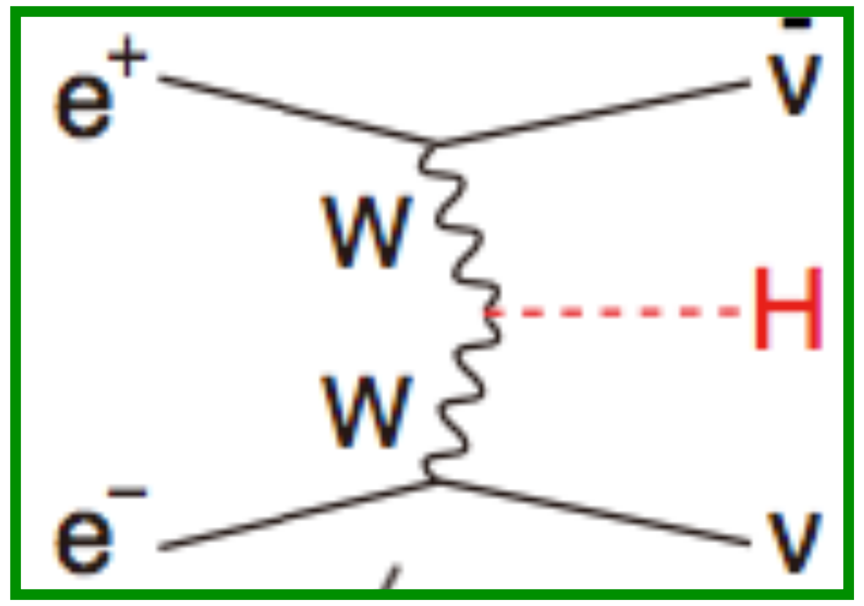
- **arXiv:1801.02840**
- **Phys. Rept. 460 (2008) 131-243**

background suppression:

- $e^+e^- \to WW$ / $\nu_e \nu_e$ strongly P-dependent since t-channel only for $e^-_L e^+_R$



signal enhancement:

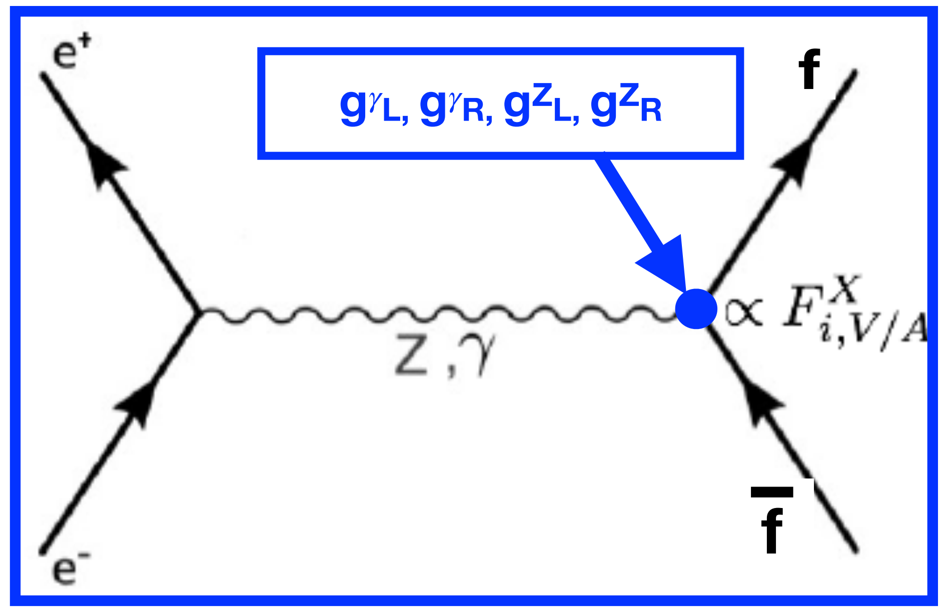


- Higgs production in WW fusion
- many BSM processes

have strong polarisation dependence => higher S/B

chiral analysis:

- SM: Z and γ differ in couplings to left- and right-handed fermions



- BSM:
  chiral structure unknown, needs to be determined!

redundancy & control of systematics:

- “wrong” polarisation yields “signal-free” control sample
- flipping *positron* polarisation controls nuisance effects on observables relying on *electron* polarisation
- essential: fast helicity reversal for *both* beams!

… and how to tackle them at colliders

electron-positron & proton-proton

Our tools:

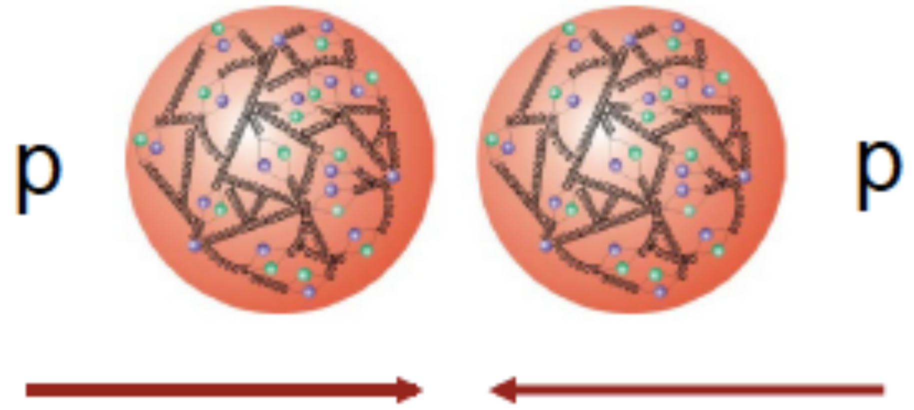
The Top and Bottom Quark

Z & W Bosons

The Higgs Boson

Discoveries of new particles ?

- elementary particles
- different E_{CM} via accelerator operation
- E_{CM} known on event-by-event level



- proton structure
- E_{CM} of "hard" interactions cover all energies < pp E_{CM}
- not known on event-by-event level

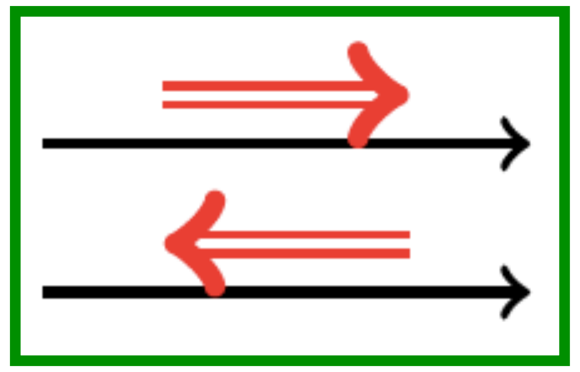
Other important parameters in e^+e^- collisions

Luminosity

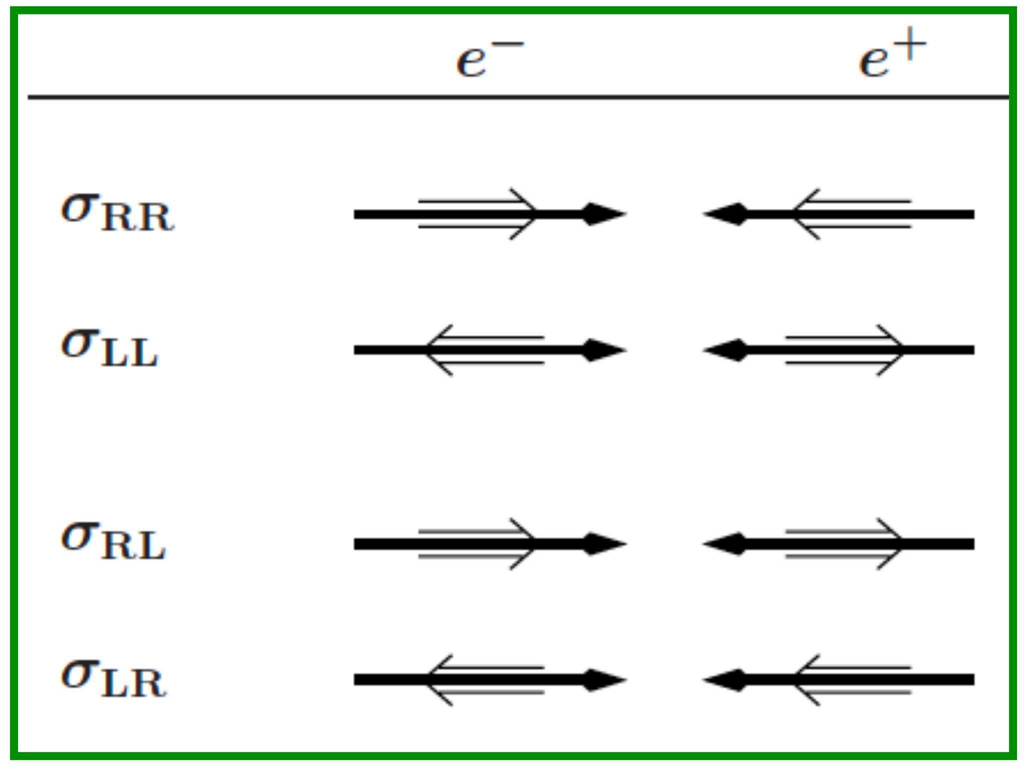
- Defines event rate => size of data set
- Future e^+e^- colliders aim for $10^3..10^6$ larger data sets than LEP
- Depends strongly on invest costs and power consumption => be careful to compare apples to apples!
- Are there fundamental boundaries *beyond* statistics?
  (e.g. theory & parametric uncertainties, detector resolution, …)

Beam polarisation:

$$P := \frac{N_R - N_L}{N_R + N_L}$$



- Electroweak interactions highly sensitive to chirality of fermions: $SU(2)_L \times U(1)$
- both beams polarised => “four colliders in one”:



Interlude: Chirality in Particle Physics

- Gauge group of weak x electromagnetic interaction: $SU(2)_L$ x U(1)
- L: left-handed, spin anti-|| momentum*
  R: right-handed, spin || momentum*
- **left-handed particles are fundamentally different from right-handed ones:**
  - only left-handed fermions (e^-) and right-handed anti-fermions (e^+) take part in the charged weak interaction, i.e. couple to the W bosons
  - there are (in the SM) no right-handed neutrinos
  - right-handed quarks and charged leptons are singlets under $SU(2)_L$
  - also couplings to the Z boson are different for left- and right-handed fermions

$$P = \frac{N_R - N_L}{N_R + N_L}$$

- **checking whether the differences between L and R are as predicted in the SM is a very sensitive test for new phenomena!**

* for massive particles, there is of course a difference between chirality and helicity, no time for this today, ask at the end in case of doubt!

The minimal Higgs program

The Higgs Boson couplings

How big can BSM effects be?

- low scale new physics
  => modification of Higgs properties!
- different *patterns* of deviations from SM prediction for different NP models
- *size* of deviations depends on NP scale
  typically few percent on tree-level:
  - MSSM, eg: $$\frac{g_{hbb}}{g_{h_{SM}bb}} = \frac{g_{h\tau\tau}}{g_{h_{SM}\tau\tau}} \simeq 1 + 1.7\% \left(\frac{1\ \mathrm{TeV}}{m_A}\right)^2$$
  - Littlest Higgs, eg m_T=1TeV: $$\frac{g_{hgg}}{g_{h_{SM}gg}} = 1-(5\% \sim 9\%)$$ $$\frac{g_{h\gamma\gamma}}{g_{h_{SM}\gamma\gamma}} = 1-(5\% \sim 6\%).$$
  - Composite Higgs, eg: $$\frac{g_{hff}}{g_{h_{SM}ff}} \simeq \begin{cases} 1-3\%(1\ \mathrm{TeV}/f)^2 & (\mathrm{MCHM4}) \\ 1-9\%(1\ \mathrm{TeV}/f)^2 & (\mathrm{MCHM5}) \end{cases}$$

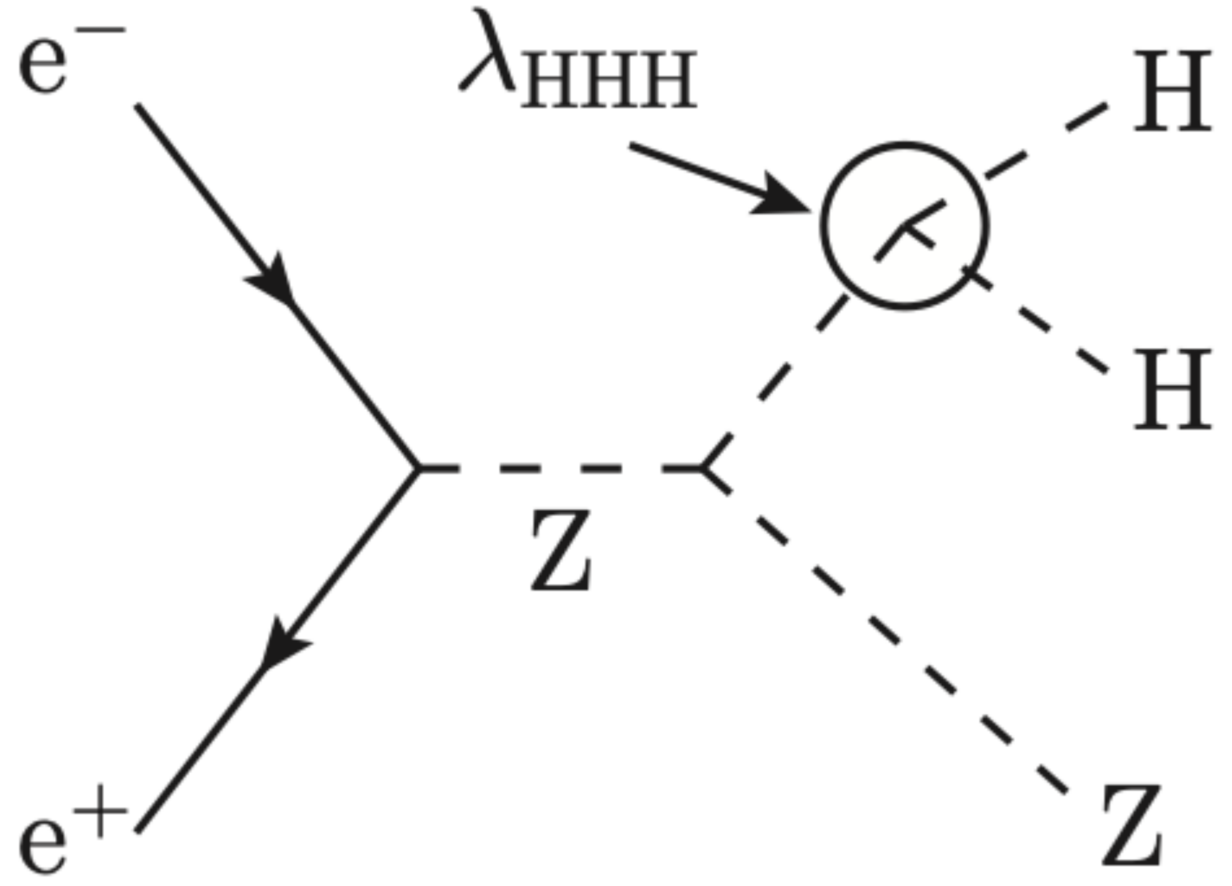
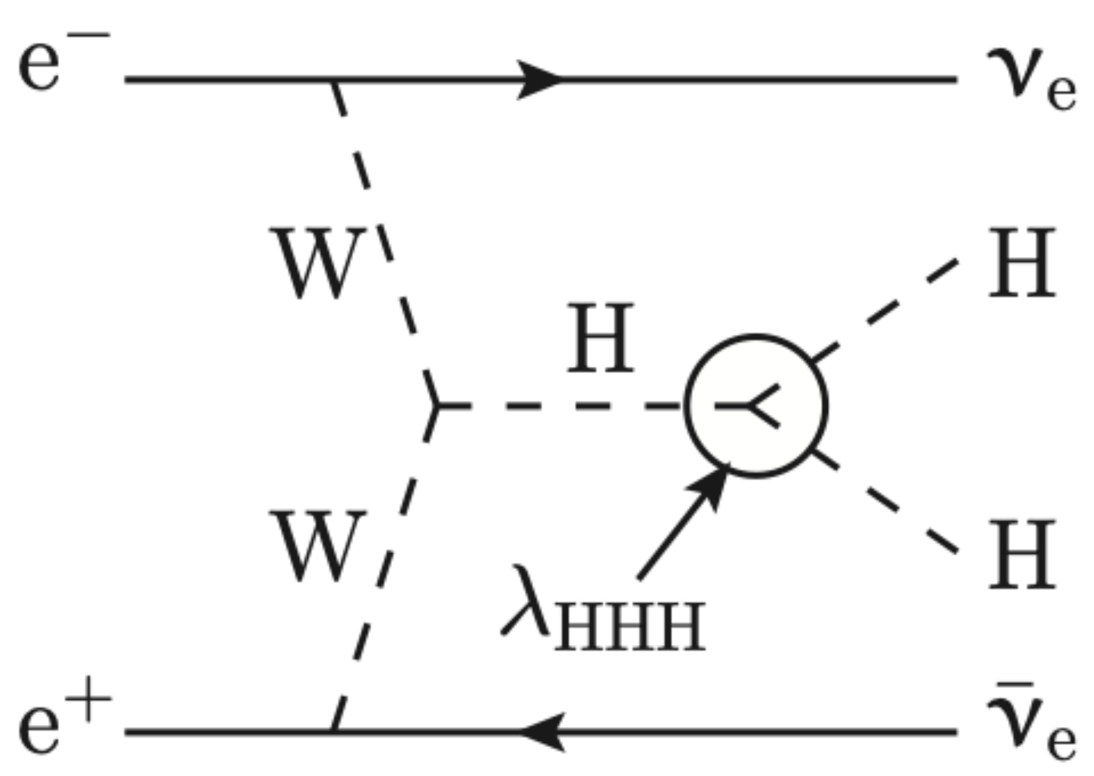
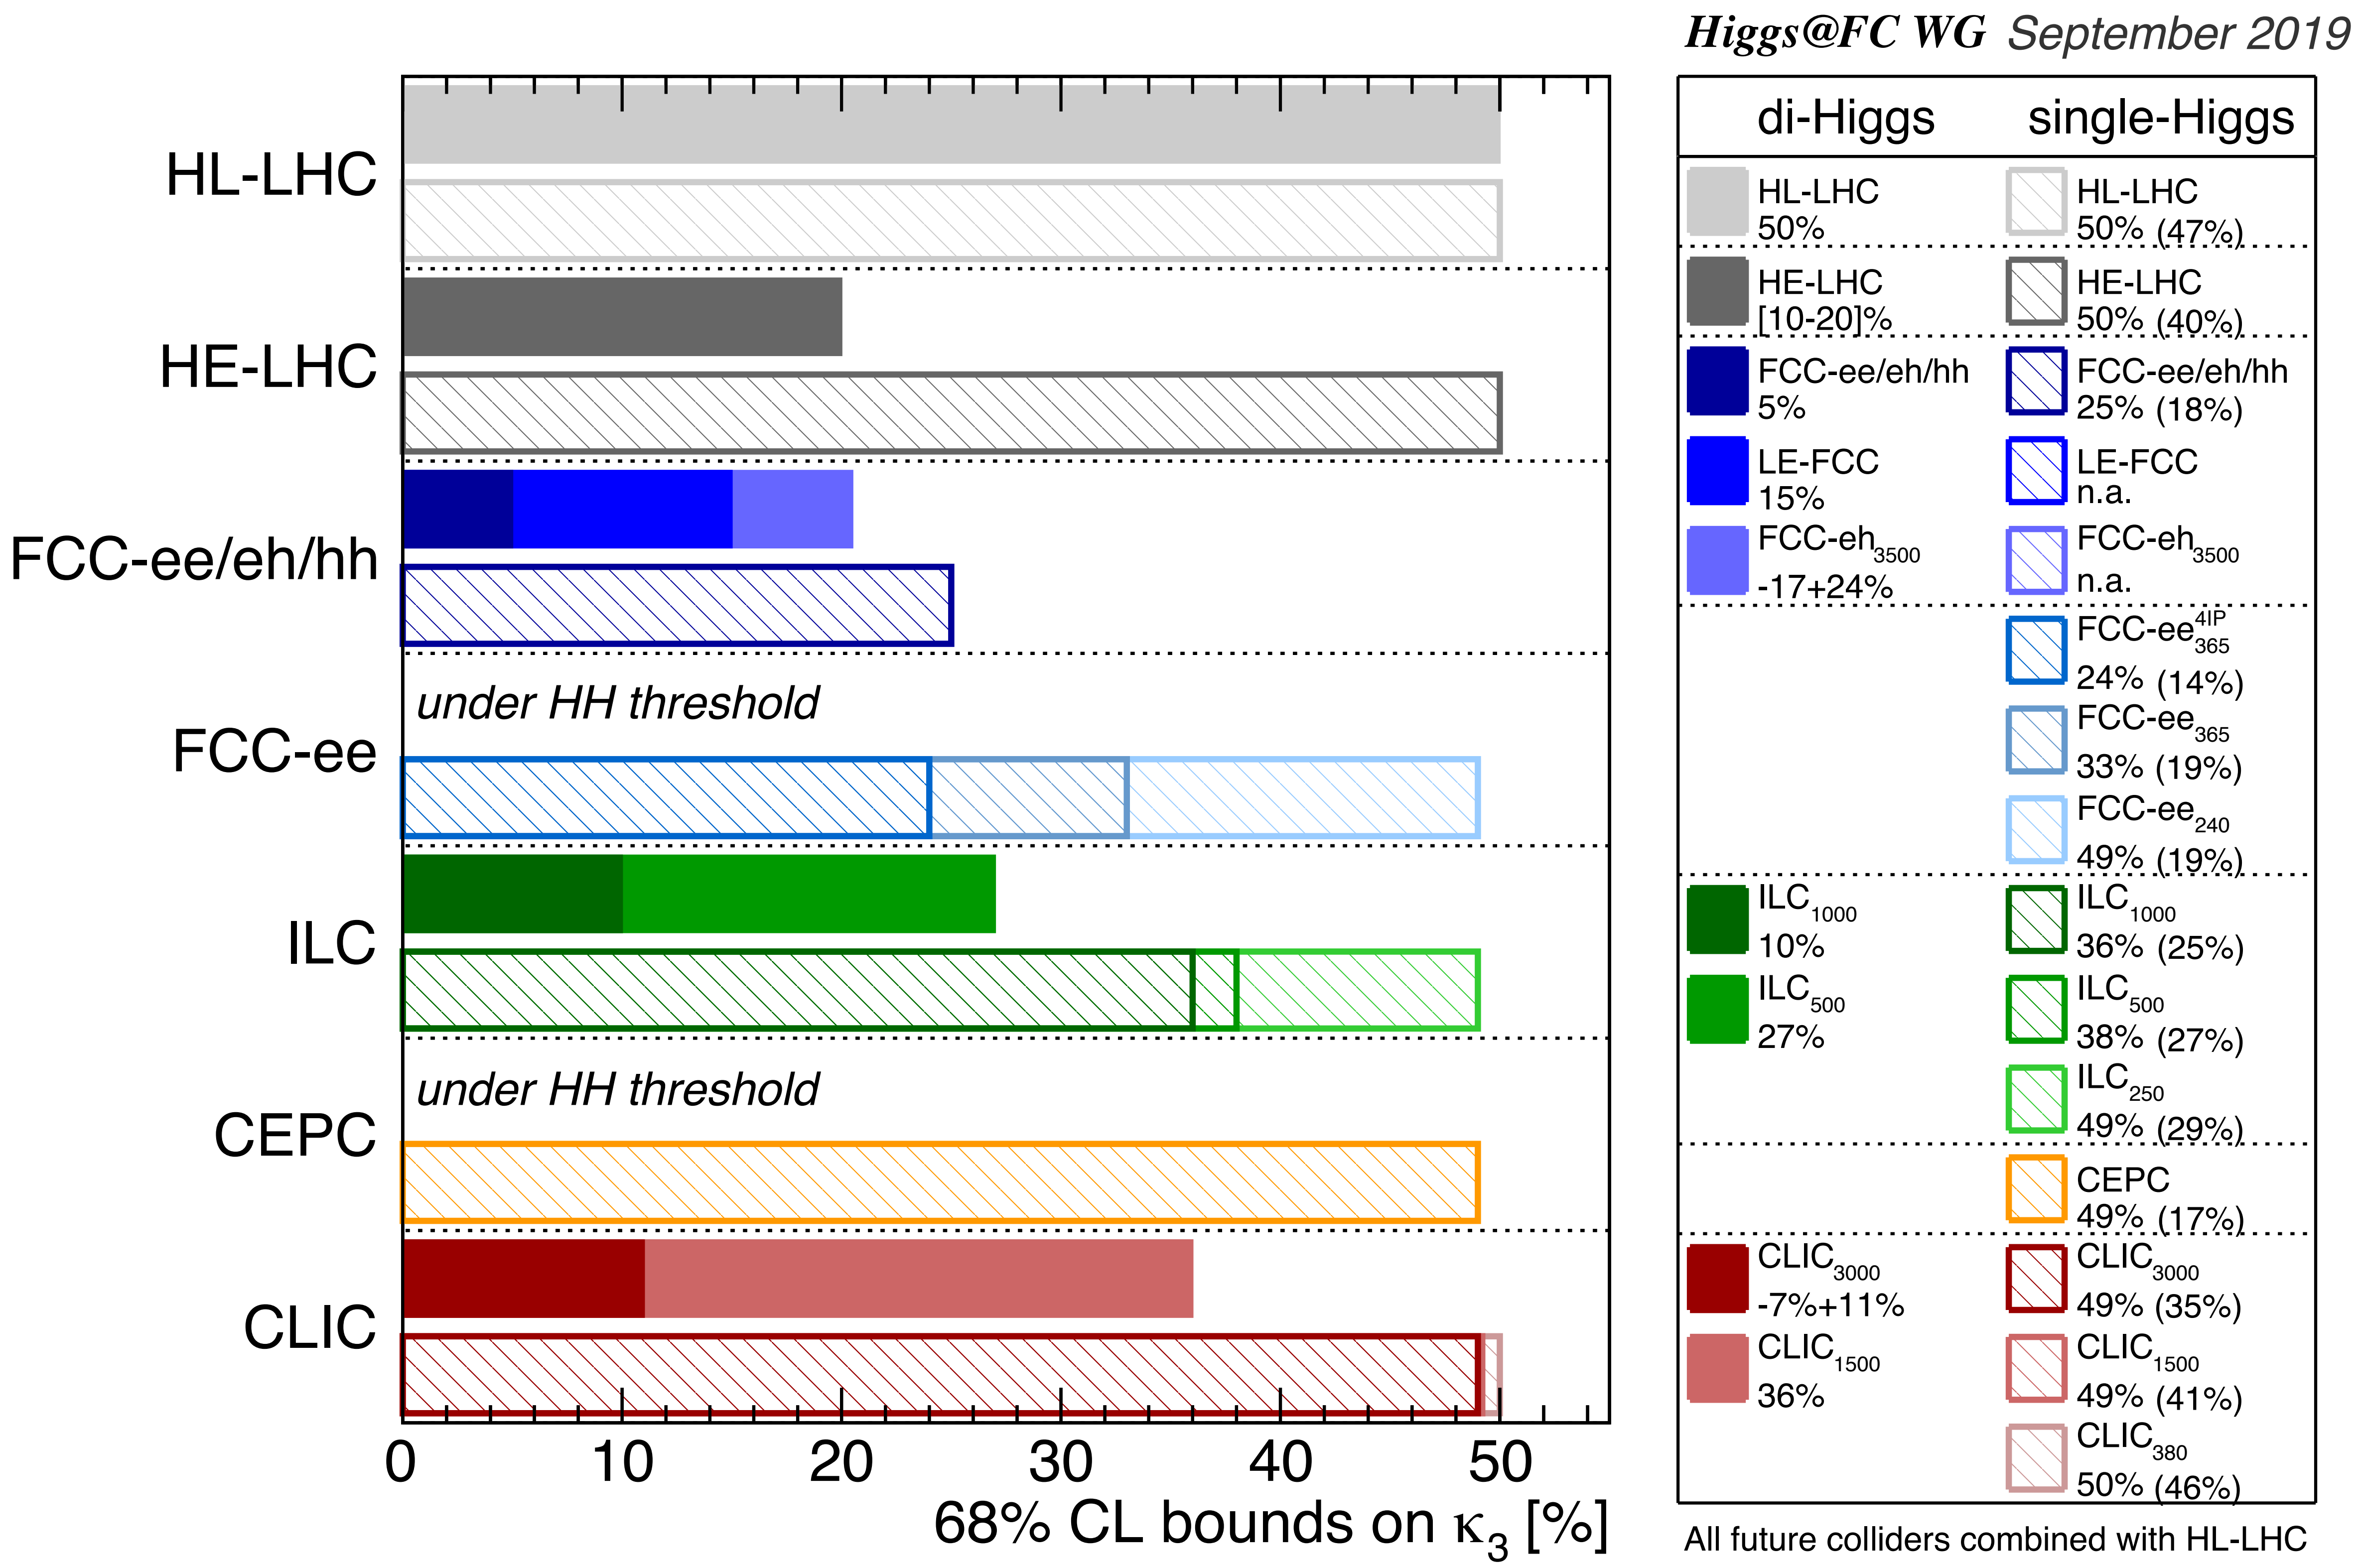
Higgs measurements only possible at 500 GeV and above: di-Higgs and ttH production





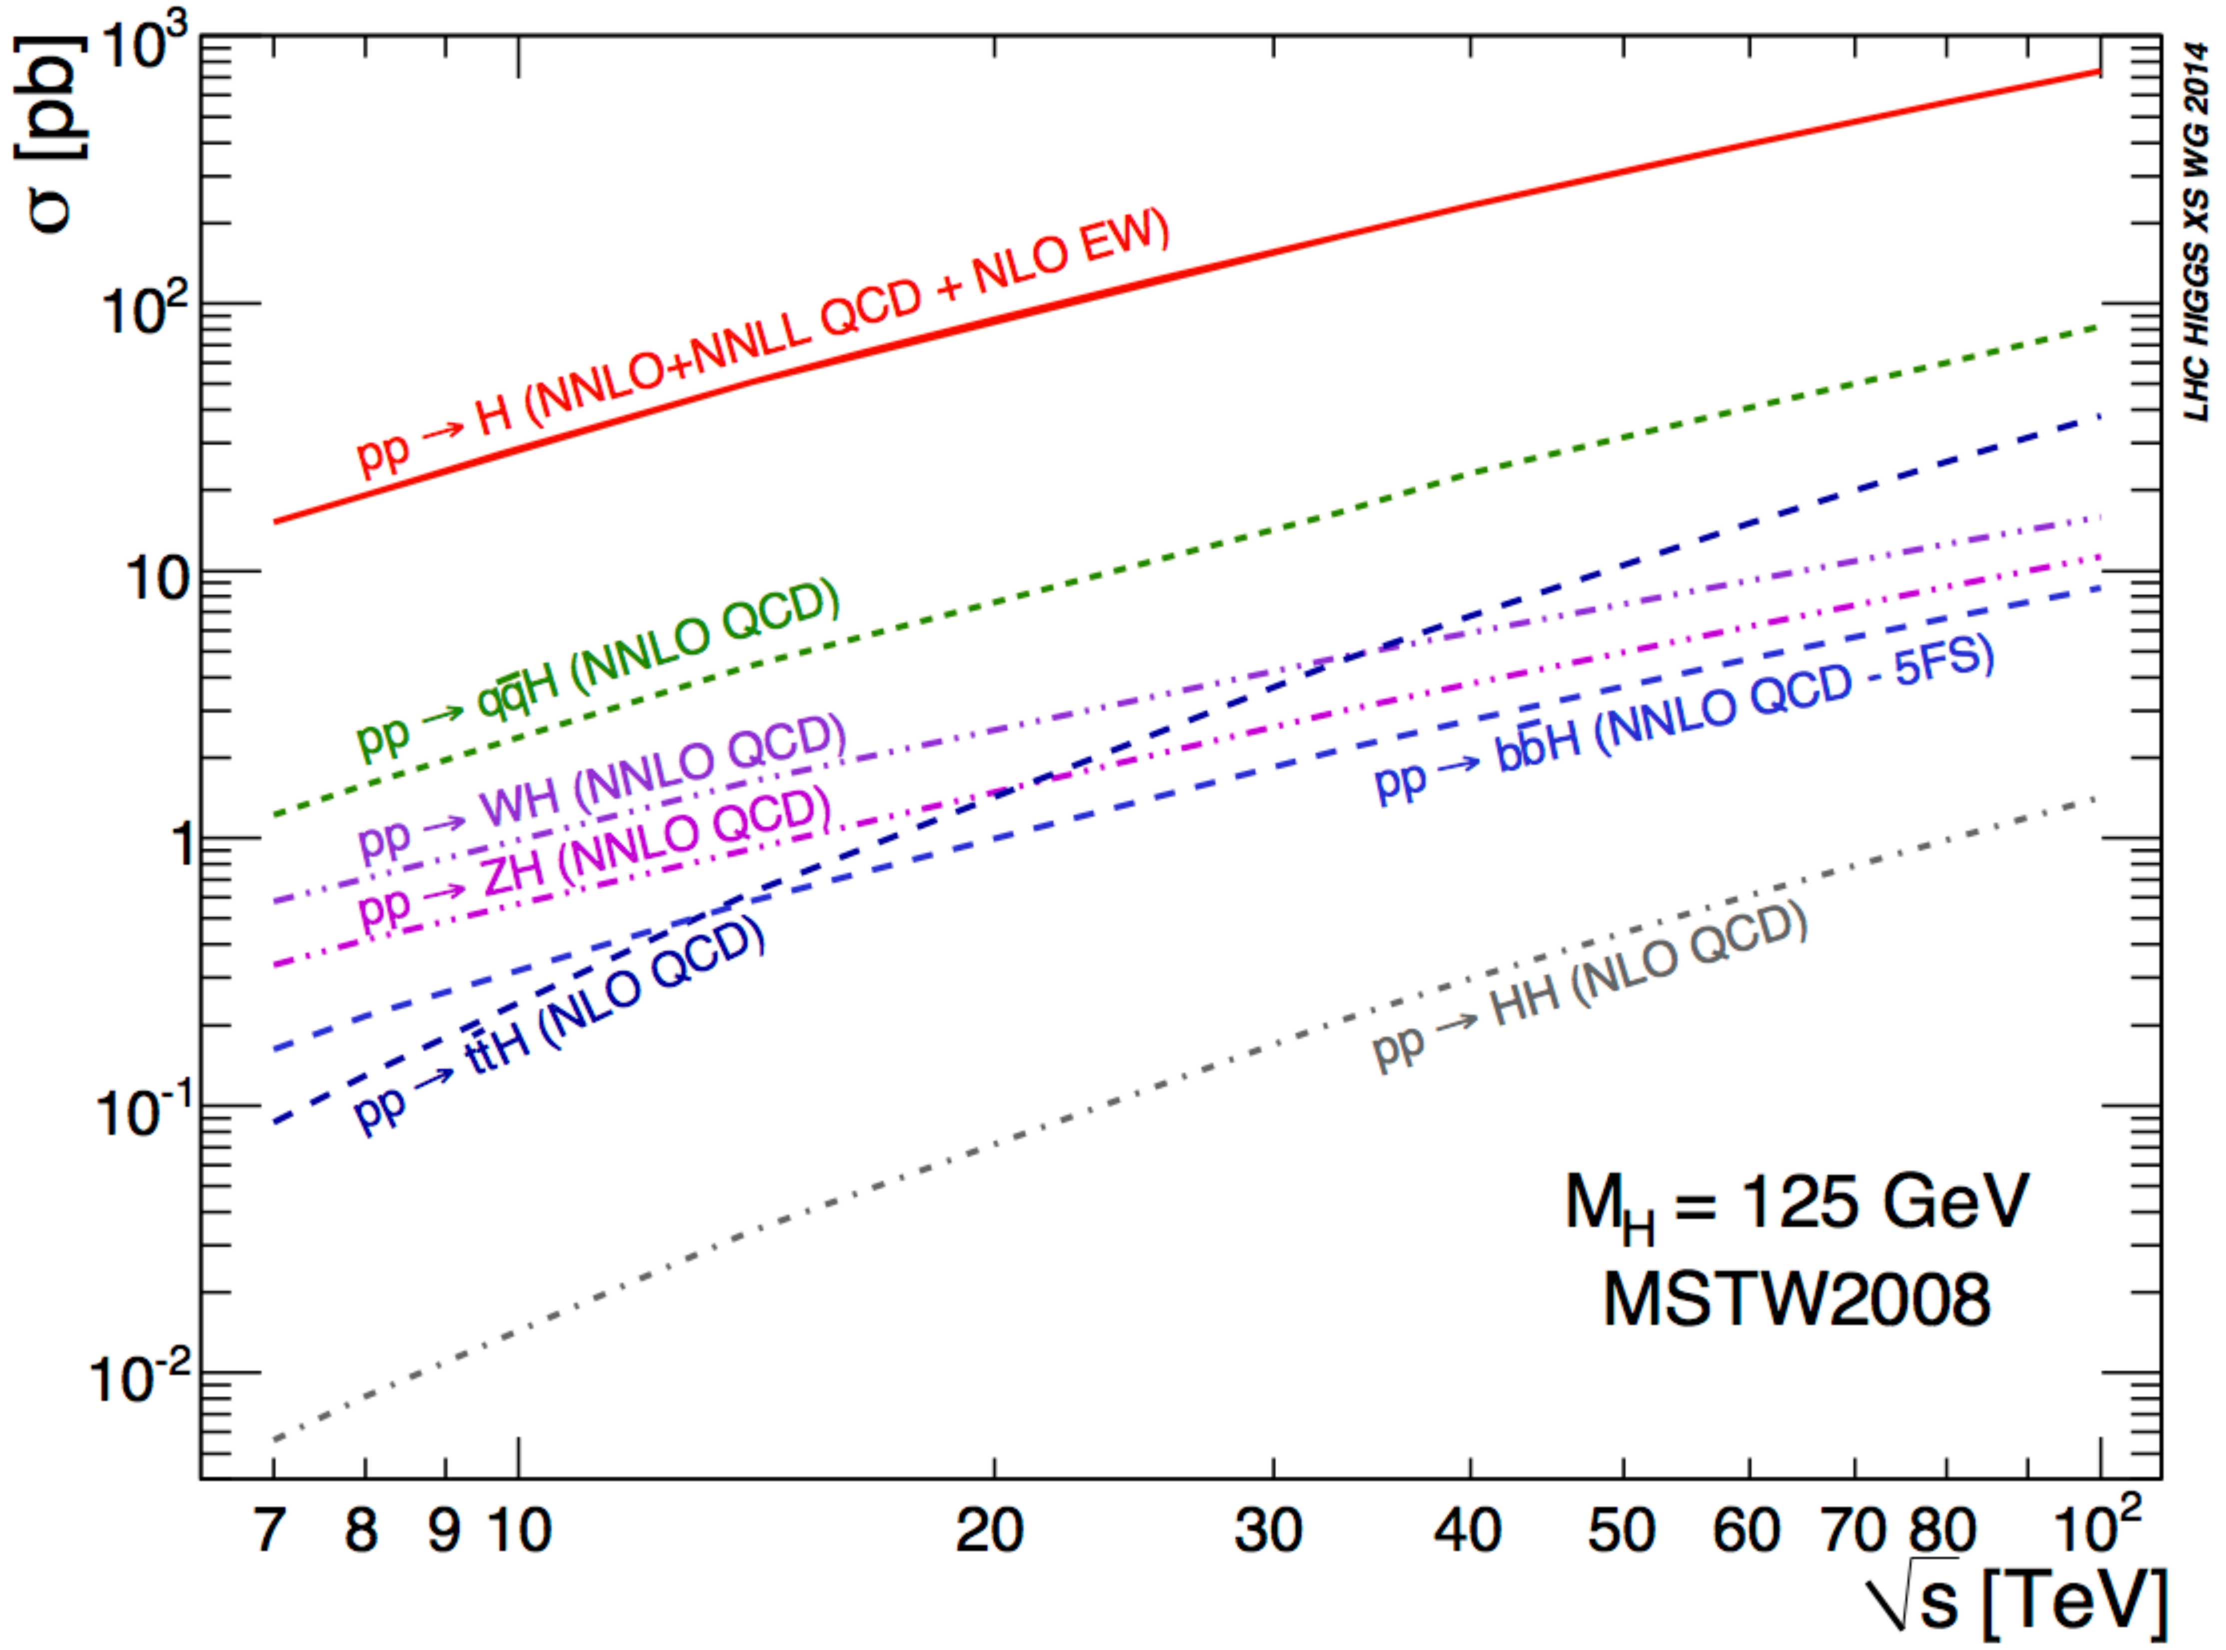
The ECFA Higgs@Future Report



At lepton colliders, double Higgs-strahlung, $e^+e^- \to ZHH$, gives stronger constraints on positive deviations ($\kappa_3 > 1$), while VBF is better in constraining negative deviations, ($\kappa_3 < 1$). While at HL-LHC, values of $\kappa_3 > 1$, as expected in models of strong first order phase transition, result in a smaller double-Higgs production cross section due to the destructive interference, at lepton colliders for the *ZHH* process they actually result in a larger cross section, and hence into an increased precision. For instance at ILC_{500}, the sensitivity around the SM value is 27% but it would reach 18% around $\kappa_3 = 1.5$.

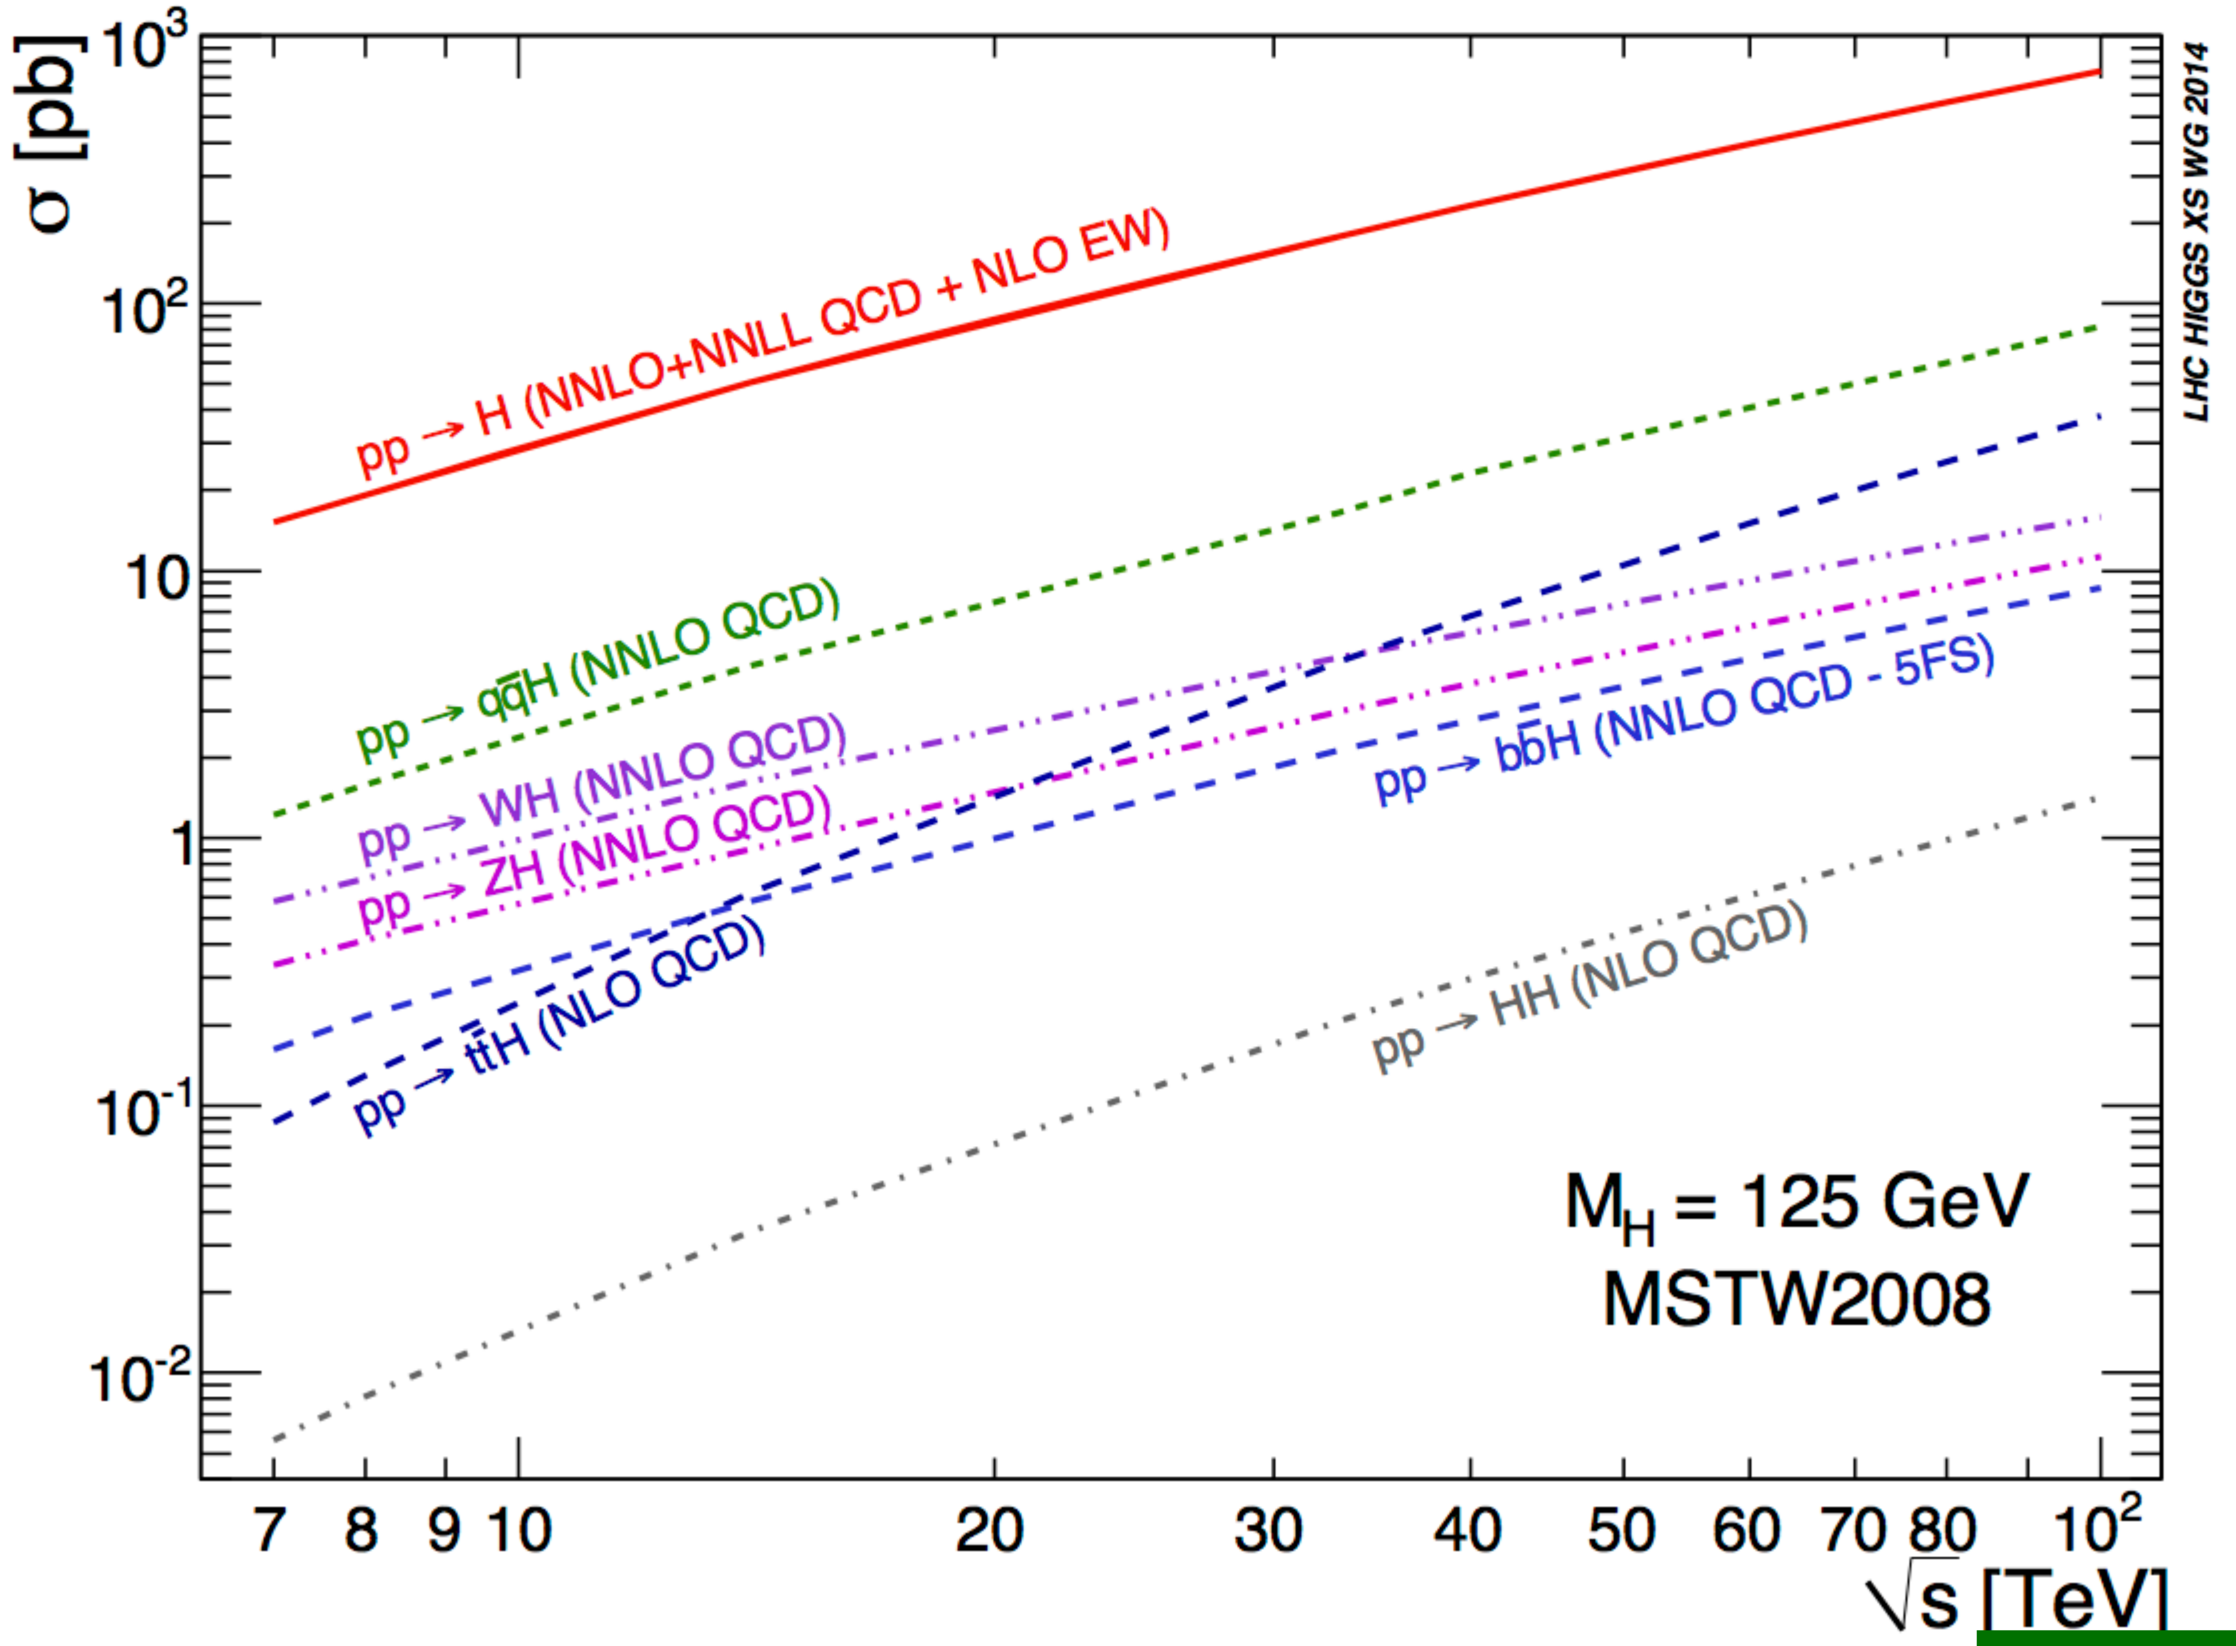
This figure applies ONLY for $\lambda = \lambda_{SM}$
no studies of BSM case apart from ILC

Di-Higgs Production Cross sections - pp



dependence on ECM:
14 TeV -> 100 TeV : ~40 x larger cross section
14 TeV -> 38 TeV: ~8 x larger cross section

Di-Higgs Production Cross sections - pp



differential distributions!

dependence on ECM:
14 TeV -> 100 TeV : ~40 x larger cross section
14 TeV -> 38 TeV: ~8 x larger cross section

vvHH (fusion): effectively only P(-80%) counts

=> VBF(ee/pp)- and Higgsstrahlung (ee) di-Higgs production have orthogonal BSM behaviour

From di-Higgs production to λ

1. Discover di-Higgs production
2. Measure cross section (total and differential!)
3. Extract λ

- Interference of diagrams with / without triple Higgs vertex
  => **k:= (δλ/λ)/(δσ/σ) > 1/2**
- k can be "improved" by using *differential* information
- **k depends on: process, *value of λ* and *E*$_{CM}$**

ILC running modes - and Z production

ILC e^+e^- collider

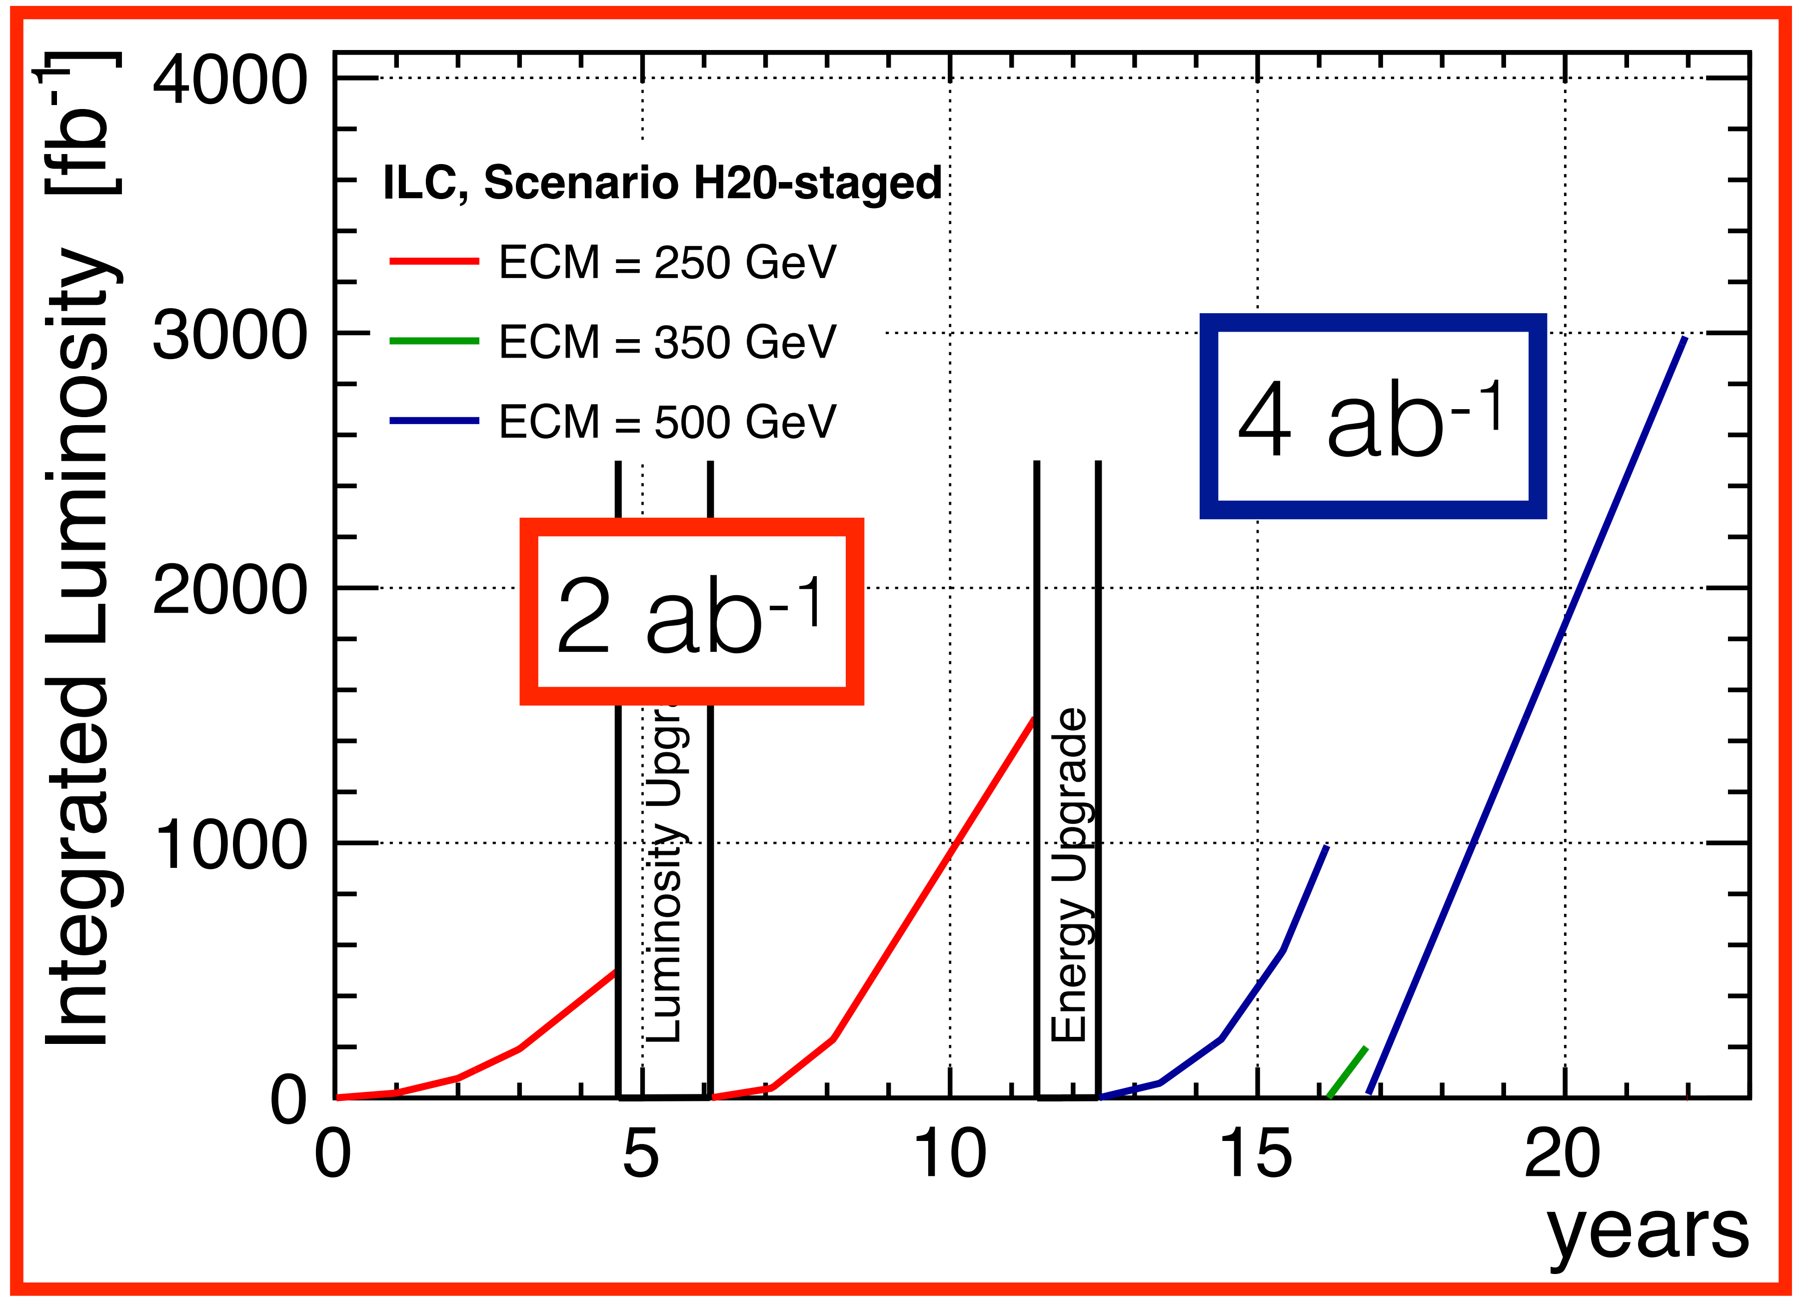
- first stage: 250 GeV
- GigaZ & WW threshold possible
- upgrades: 500 GeV, 1 TeV

polarised beams

- $P(e^-) \geq \pm 80\%$,
- $P(e^+) = \pm 30\%$,
  at 500 GeV upgradable to 60%

Since 2015
arXiv:1506.07830

$\sqrt{s}$	$\int \mathscr{L} dt$
250 GeV	2 ab^{-1}
350 GeV	0.2 ab^{-1}
500 GeV	4 ab^{-1}
1 TeV	8 ab^{-1}
91 GeV	0.1 ab^{-1}
161 GeV	0.5 ab^{-1}



(radiative) Z's in 2 ab^{-1} at **250 GeV**:

- ~77 10^6 Z->qq
- ~12 10^6 Z->ll

=> substantial increase over LEP,
….and polarised!

Z's in 0.1ab^{-1} at **91 GeV**:

- ~3.4 10^9 Z->qq
- ~0.5 10^9 Z->ll

~1-2 years of running (after lumi upgrade)

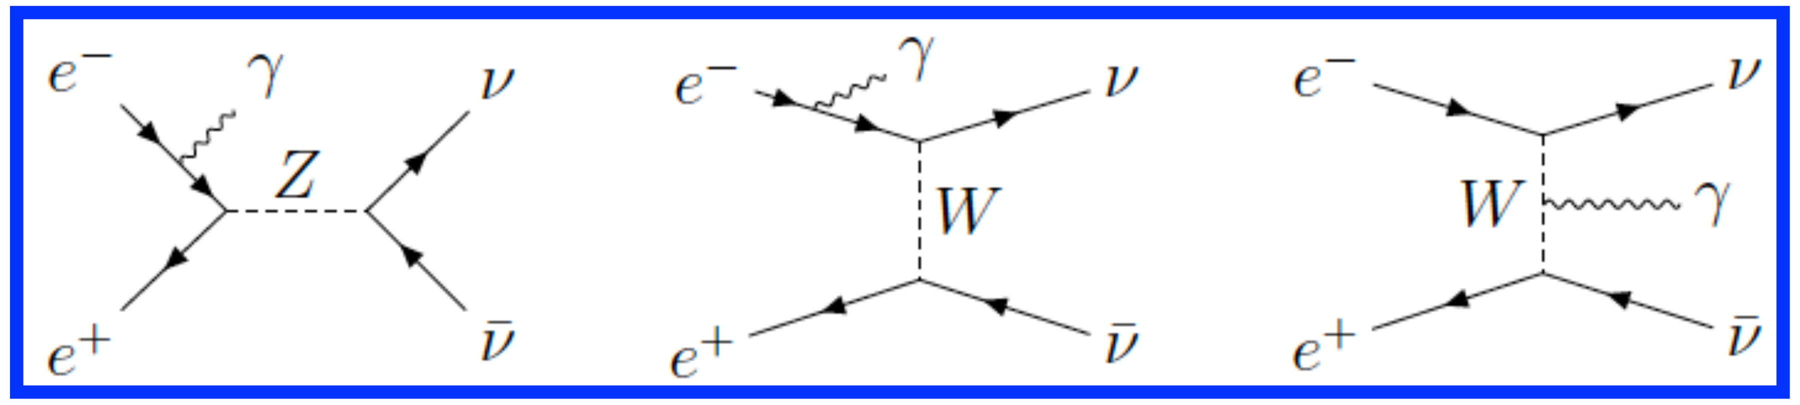
Accelerator implementation - arXiv:1908.08212

Phys. Rev. D 101 (2020) 7

Polarisation & Beyond the SM: Dark Matter

Background reduction & Systematics

- mono-photon search $e^+e^- \rightarrow \chi\chi\gamma$
- main SM background: $e^+e^- \rightarrow \nu\nu\gamma$



reduced ~10x with polarisation

- shape of observable distributions changes with polarisation sign
  => combination of samples with sign(P) = (–,+), (+,–), (+,+), (–,–)
  beats down the effect of systematic uncertainties

200 fb^{-1} polarised ≈ 10 ab^{-1} unpolarised

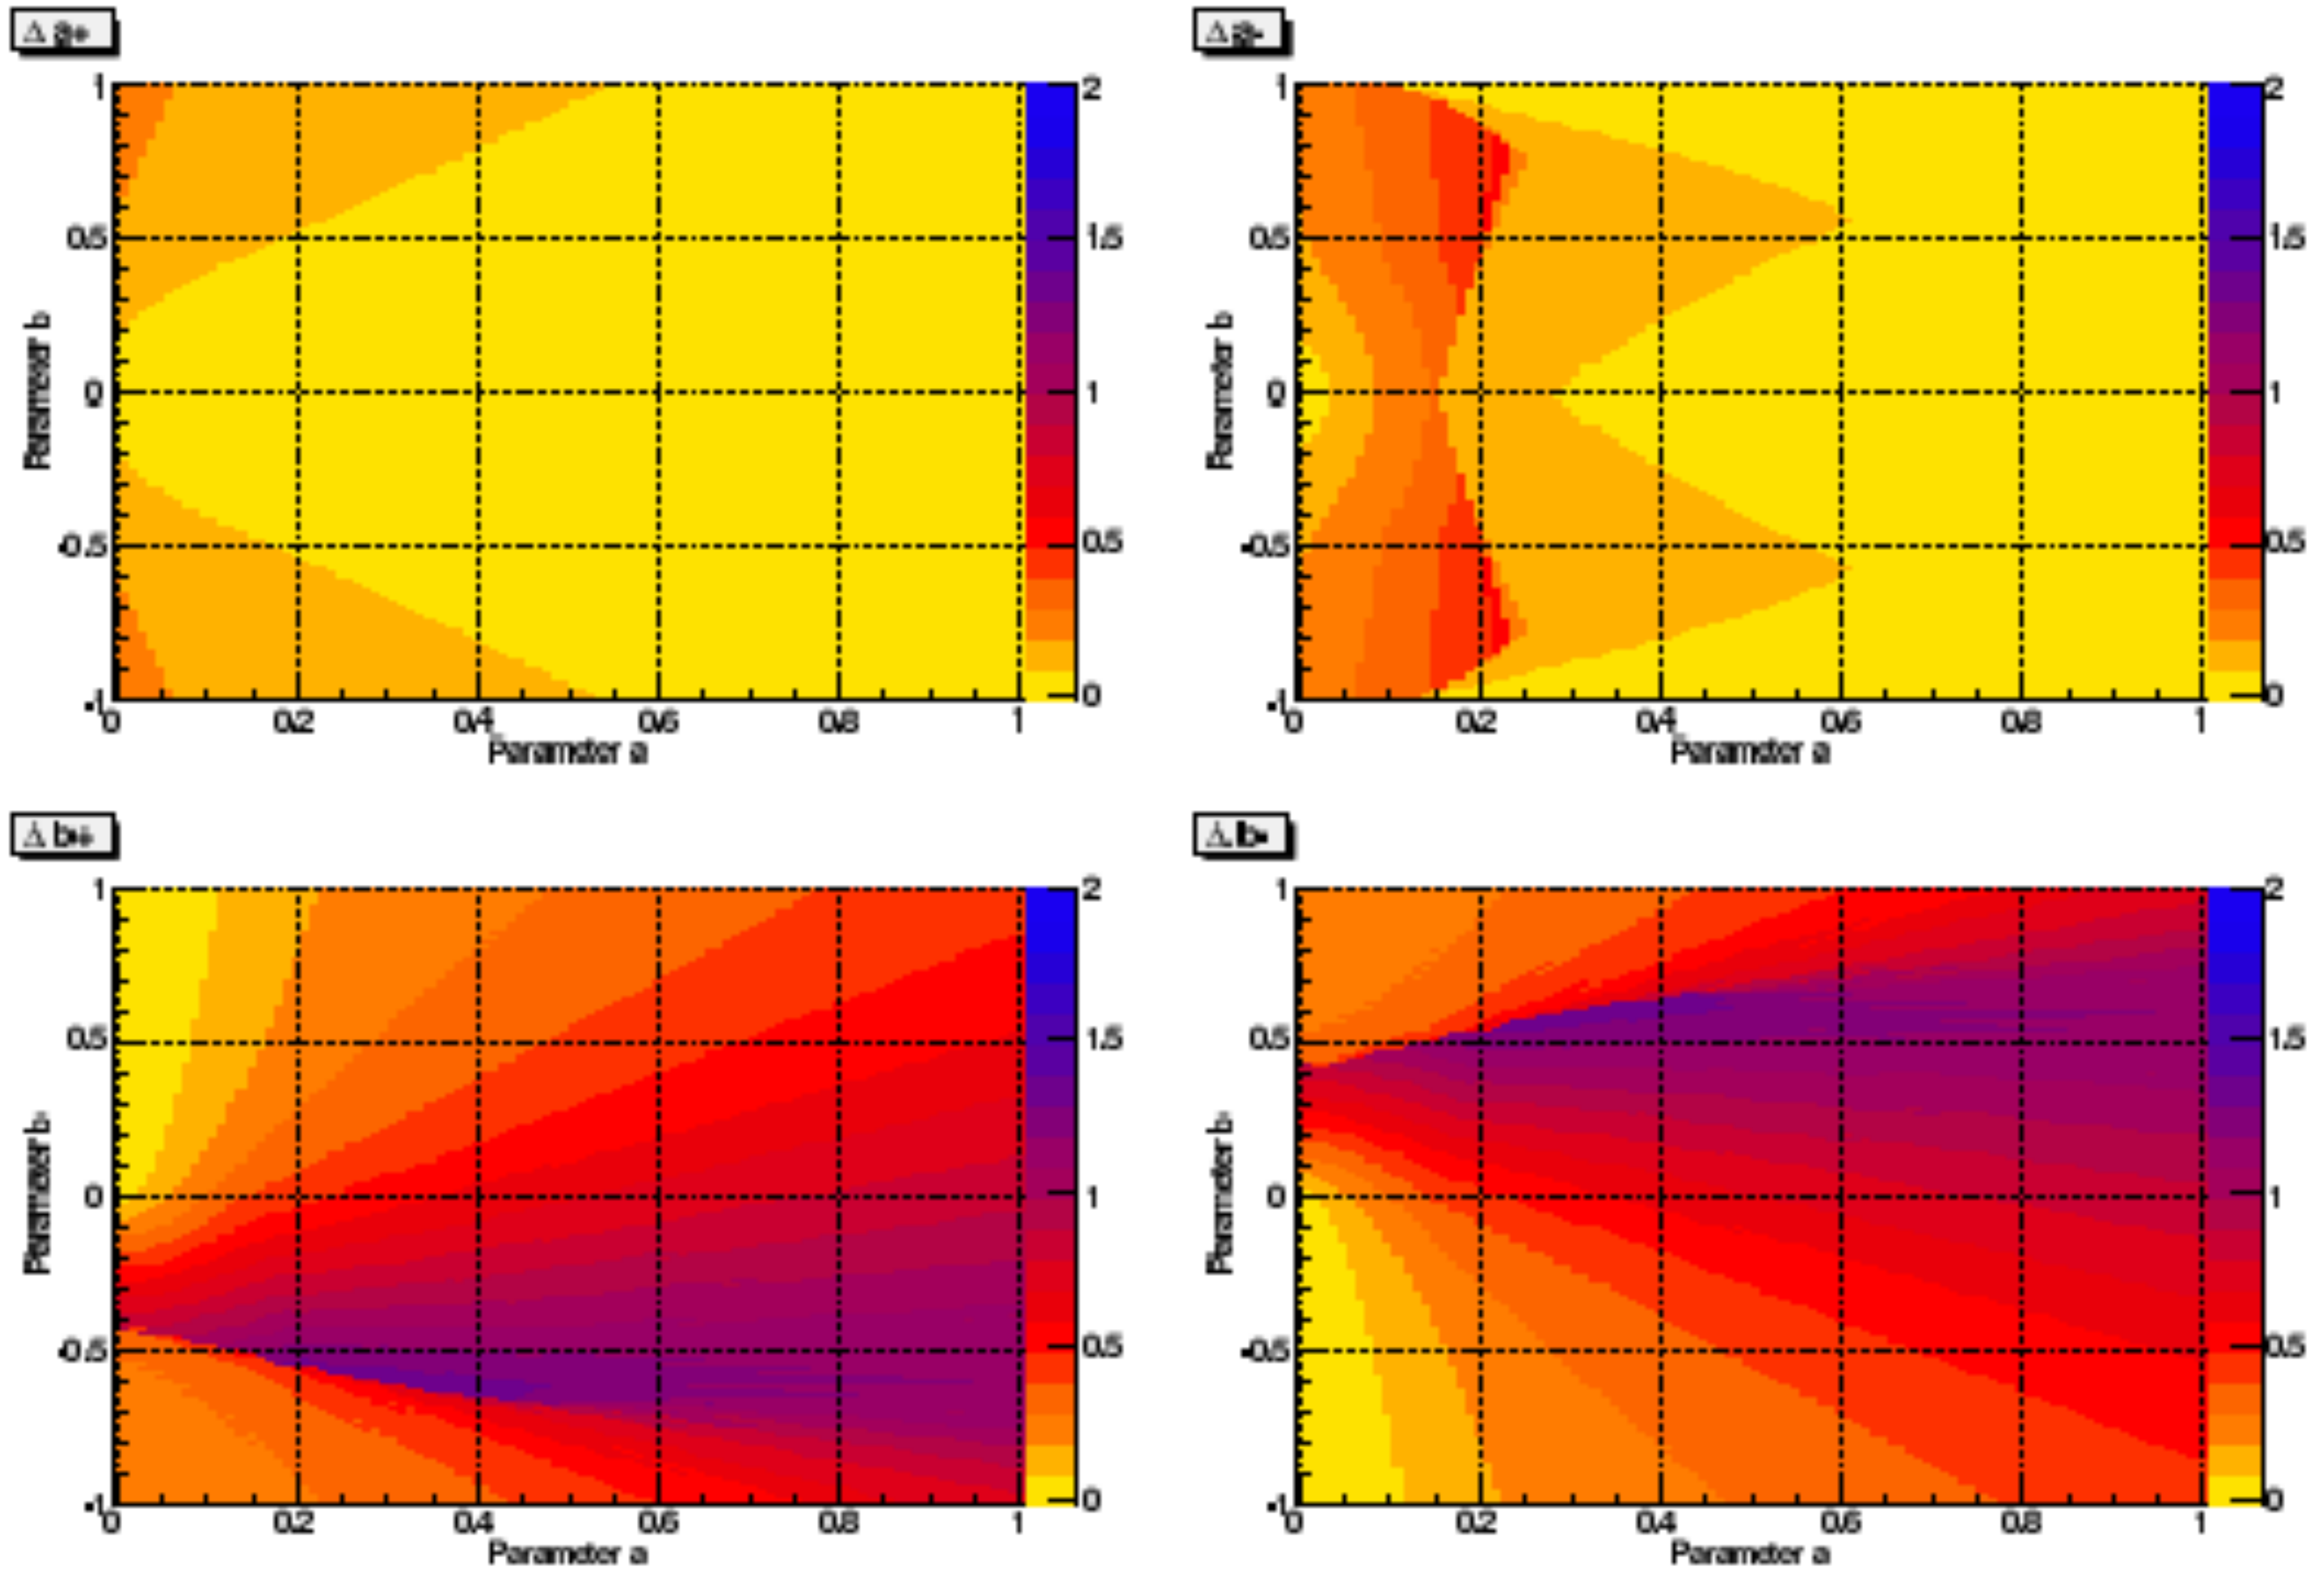
CP odd admixture

∗ coupling of a general CP-mixed state Φ to $t\bar{t}$: $a, b \in [-1, .., 1]$

$$C_{tt\Phi} = -i \frac{e}{\sin\theta_W} \frac{m_t}{2M_W}(a + ib\gamma_5) \equiv -ig_{ttH}(a + ib\gamma_5)$$

$\mathcal{A}$ccuracy on a, b from the $\mathcal{C}$ombined $\mathcal{O}$bservables σ, P_t, A_ϕ

Godbole,Hangst,MMM,Rindani,Sharma



$\sqrt{s} = 800$ GeV, $\int \mathcal{L} = 500$ fb^{-1}, polarised $e^\pm$ beams

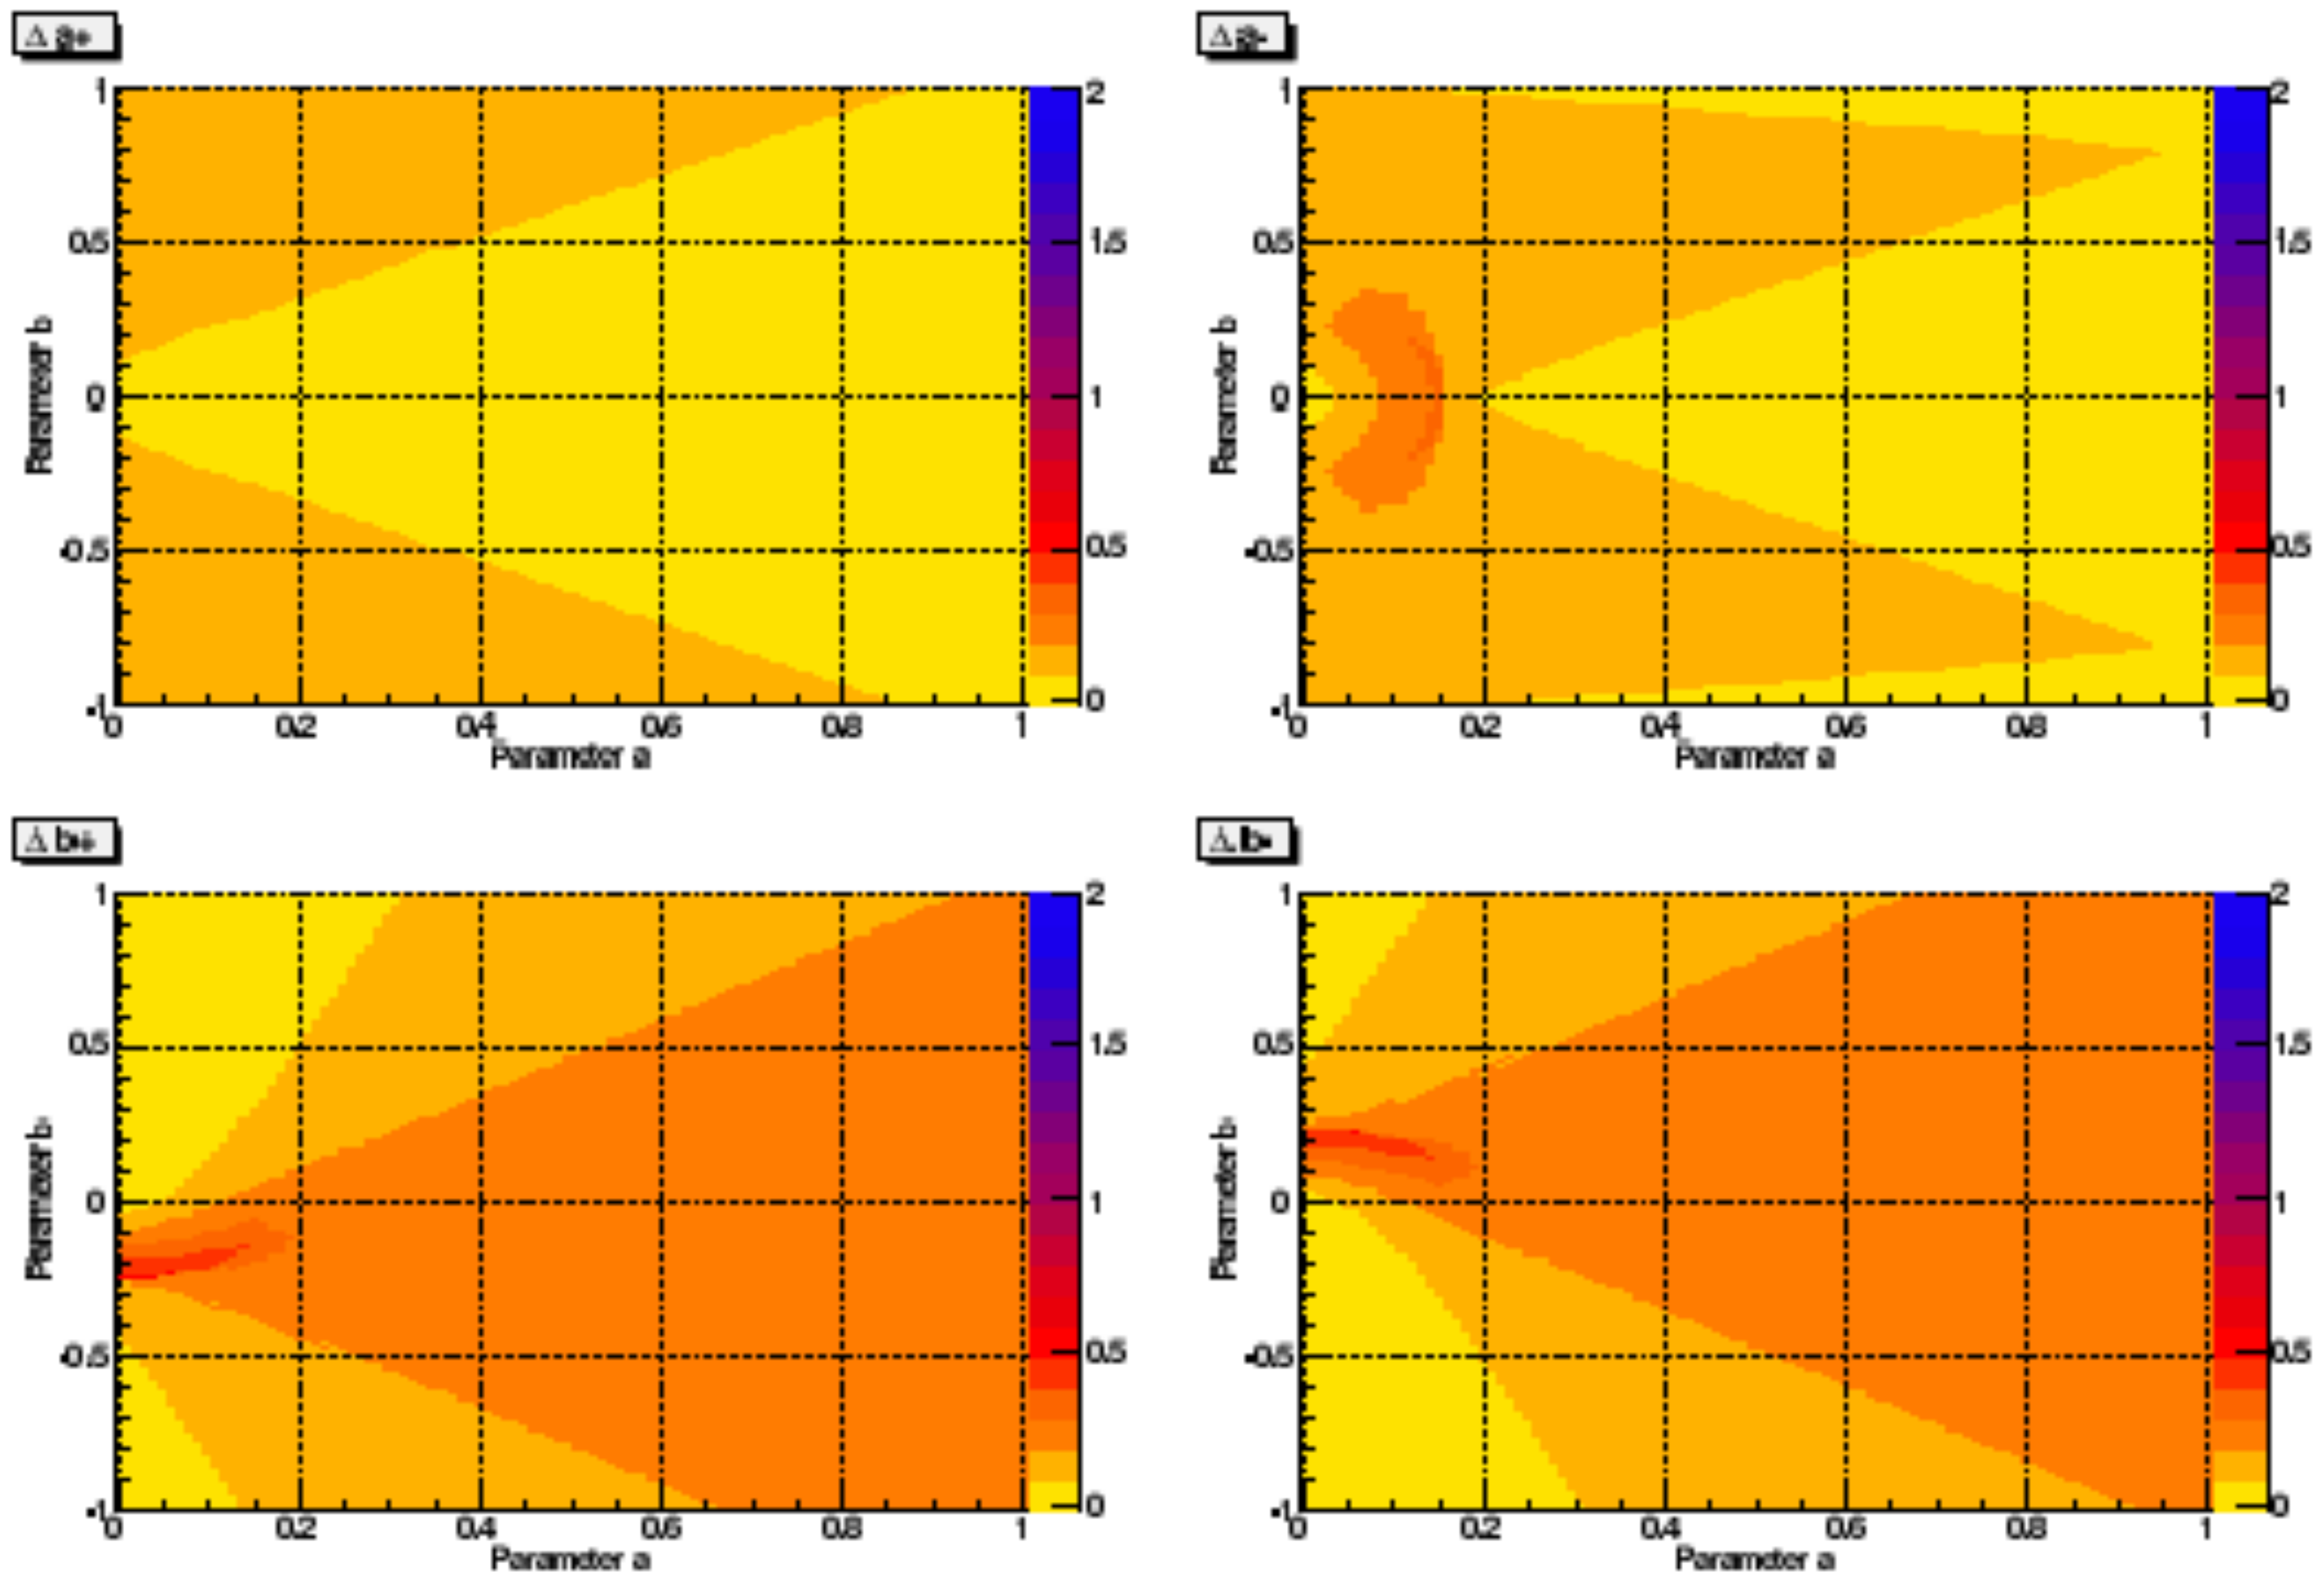
CP odd admixture

∗ coupling of a general CP-mixed state Φ to $t\bar{t}$: $a, b \in [-1, .., 1]$

$$C_{tt\Phi} = -i\frac{e}{\sin\theta_W}\frac{m_t}{2M_W}(a + ib\gamma_5) \equiv -ig_{ttH}(a + ib\gamma_5)$$

Accuracy on a, b from Combined Observables σ, P_t, A_ϕ – $\sqrt{s} = 3$ TeV

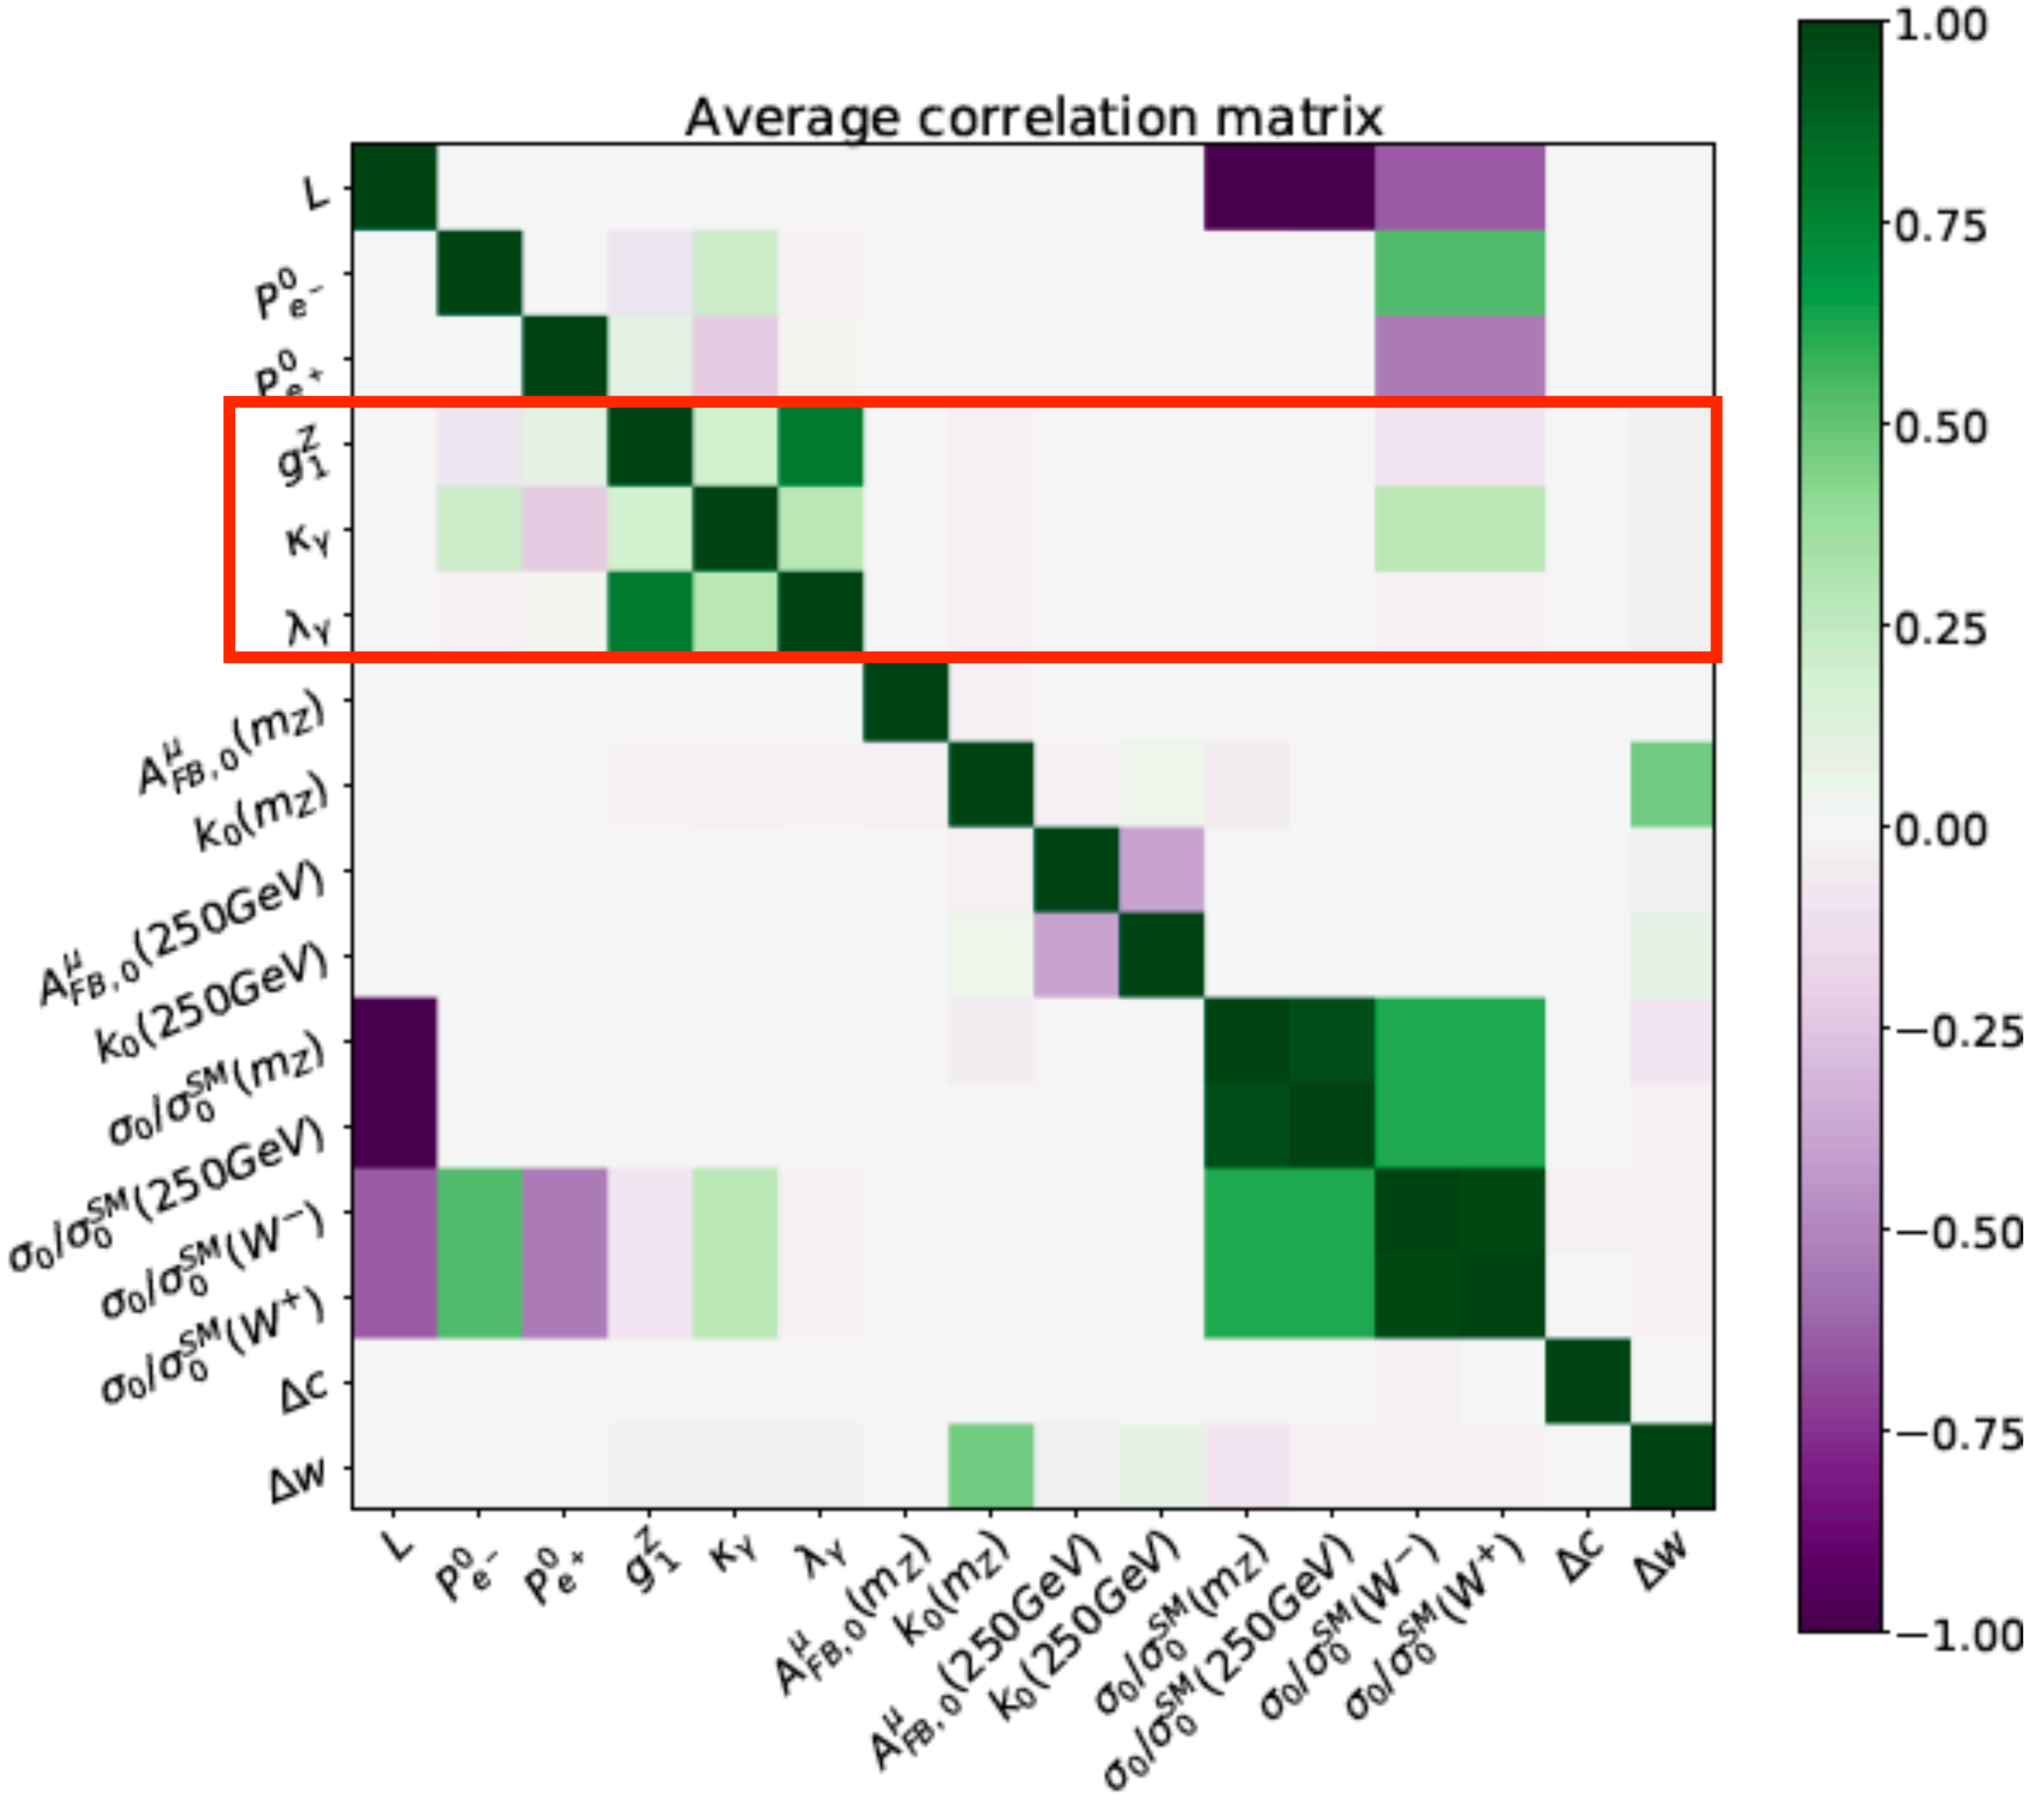
Godbole,Hangst,MMM,Rindani,Sharma

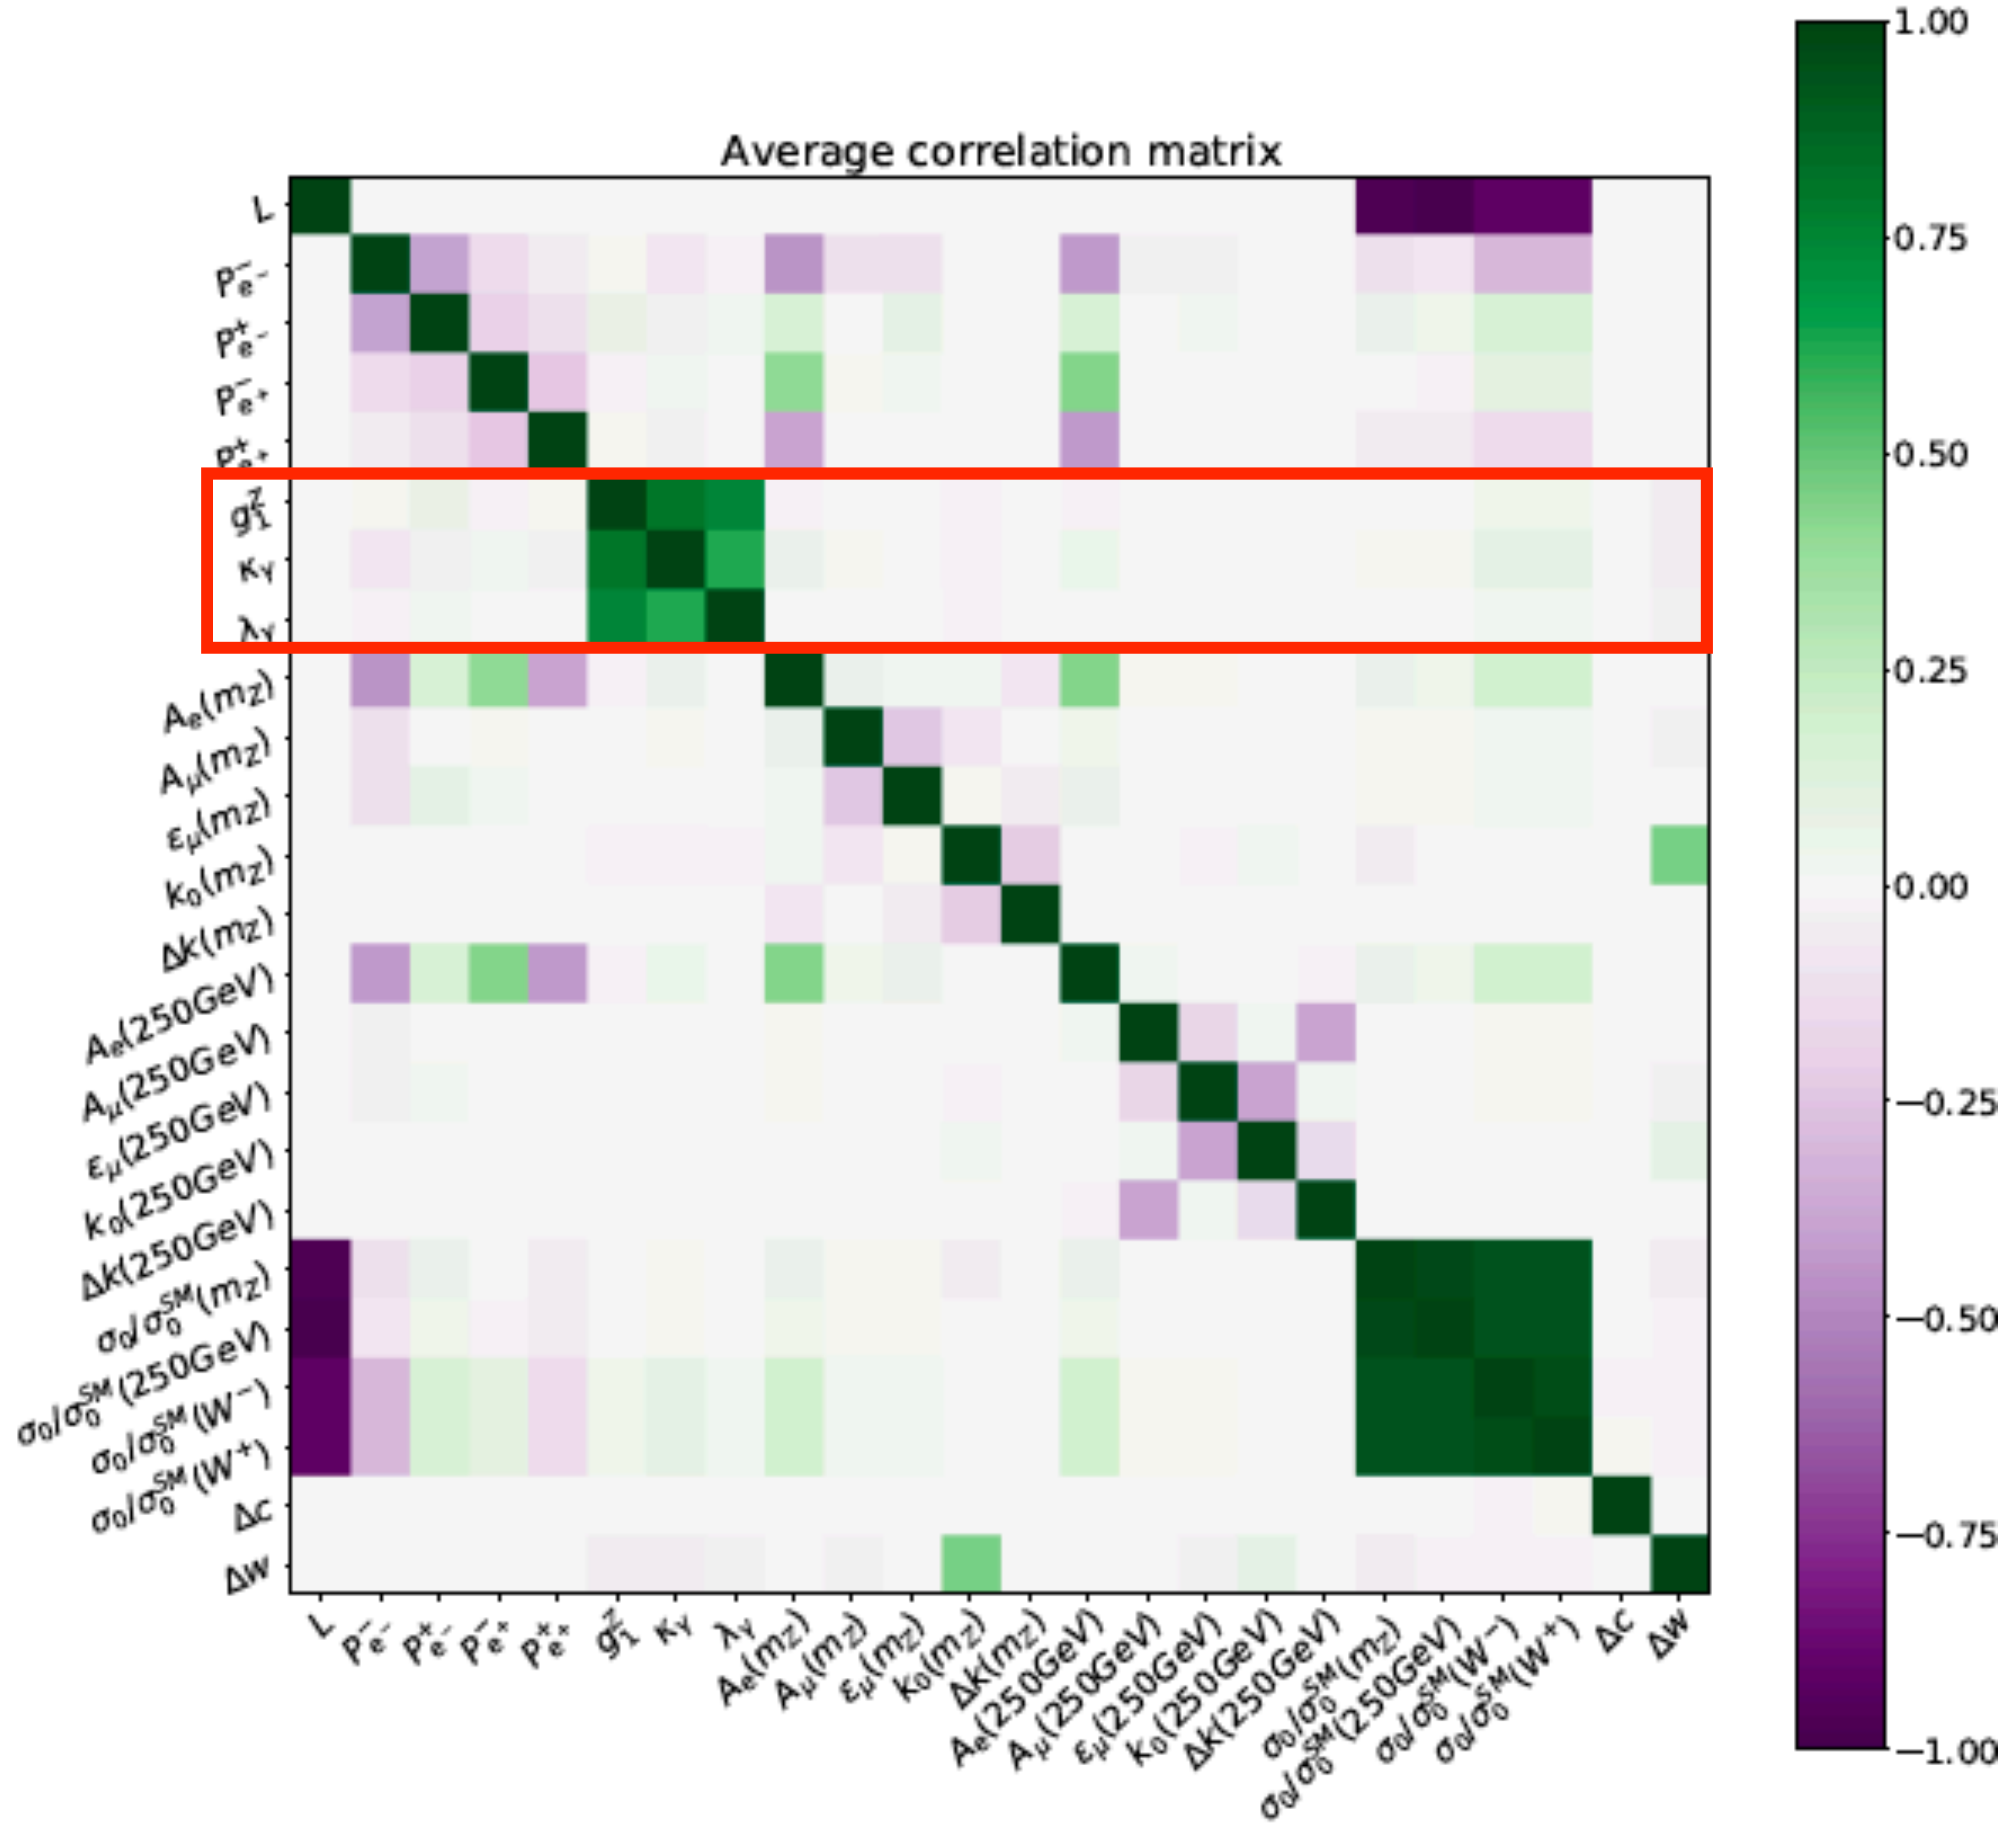


$\sqrt{s} = 3$ TeV, $\int \mathcal{L} = 3$ ab^{-1}, polarised $e^{\pm}$ beams

Can we determine polarisation AND devitions from SM?

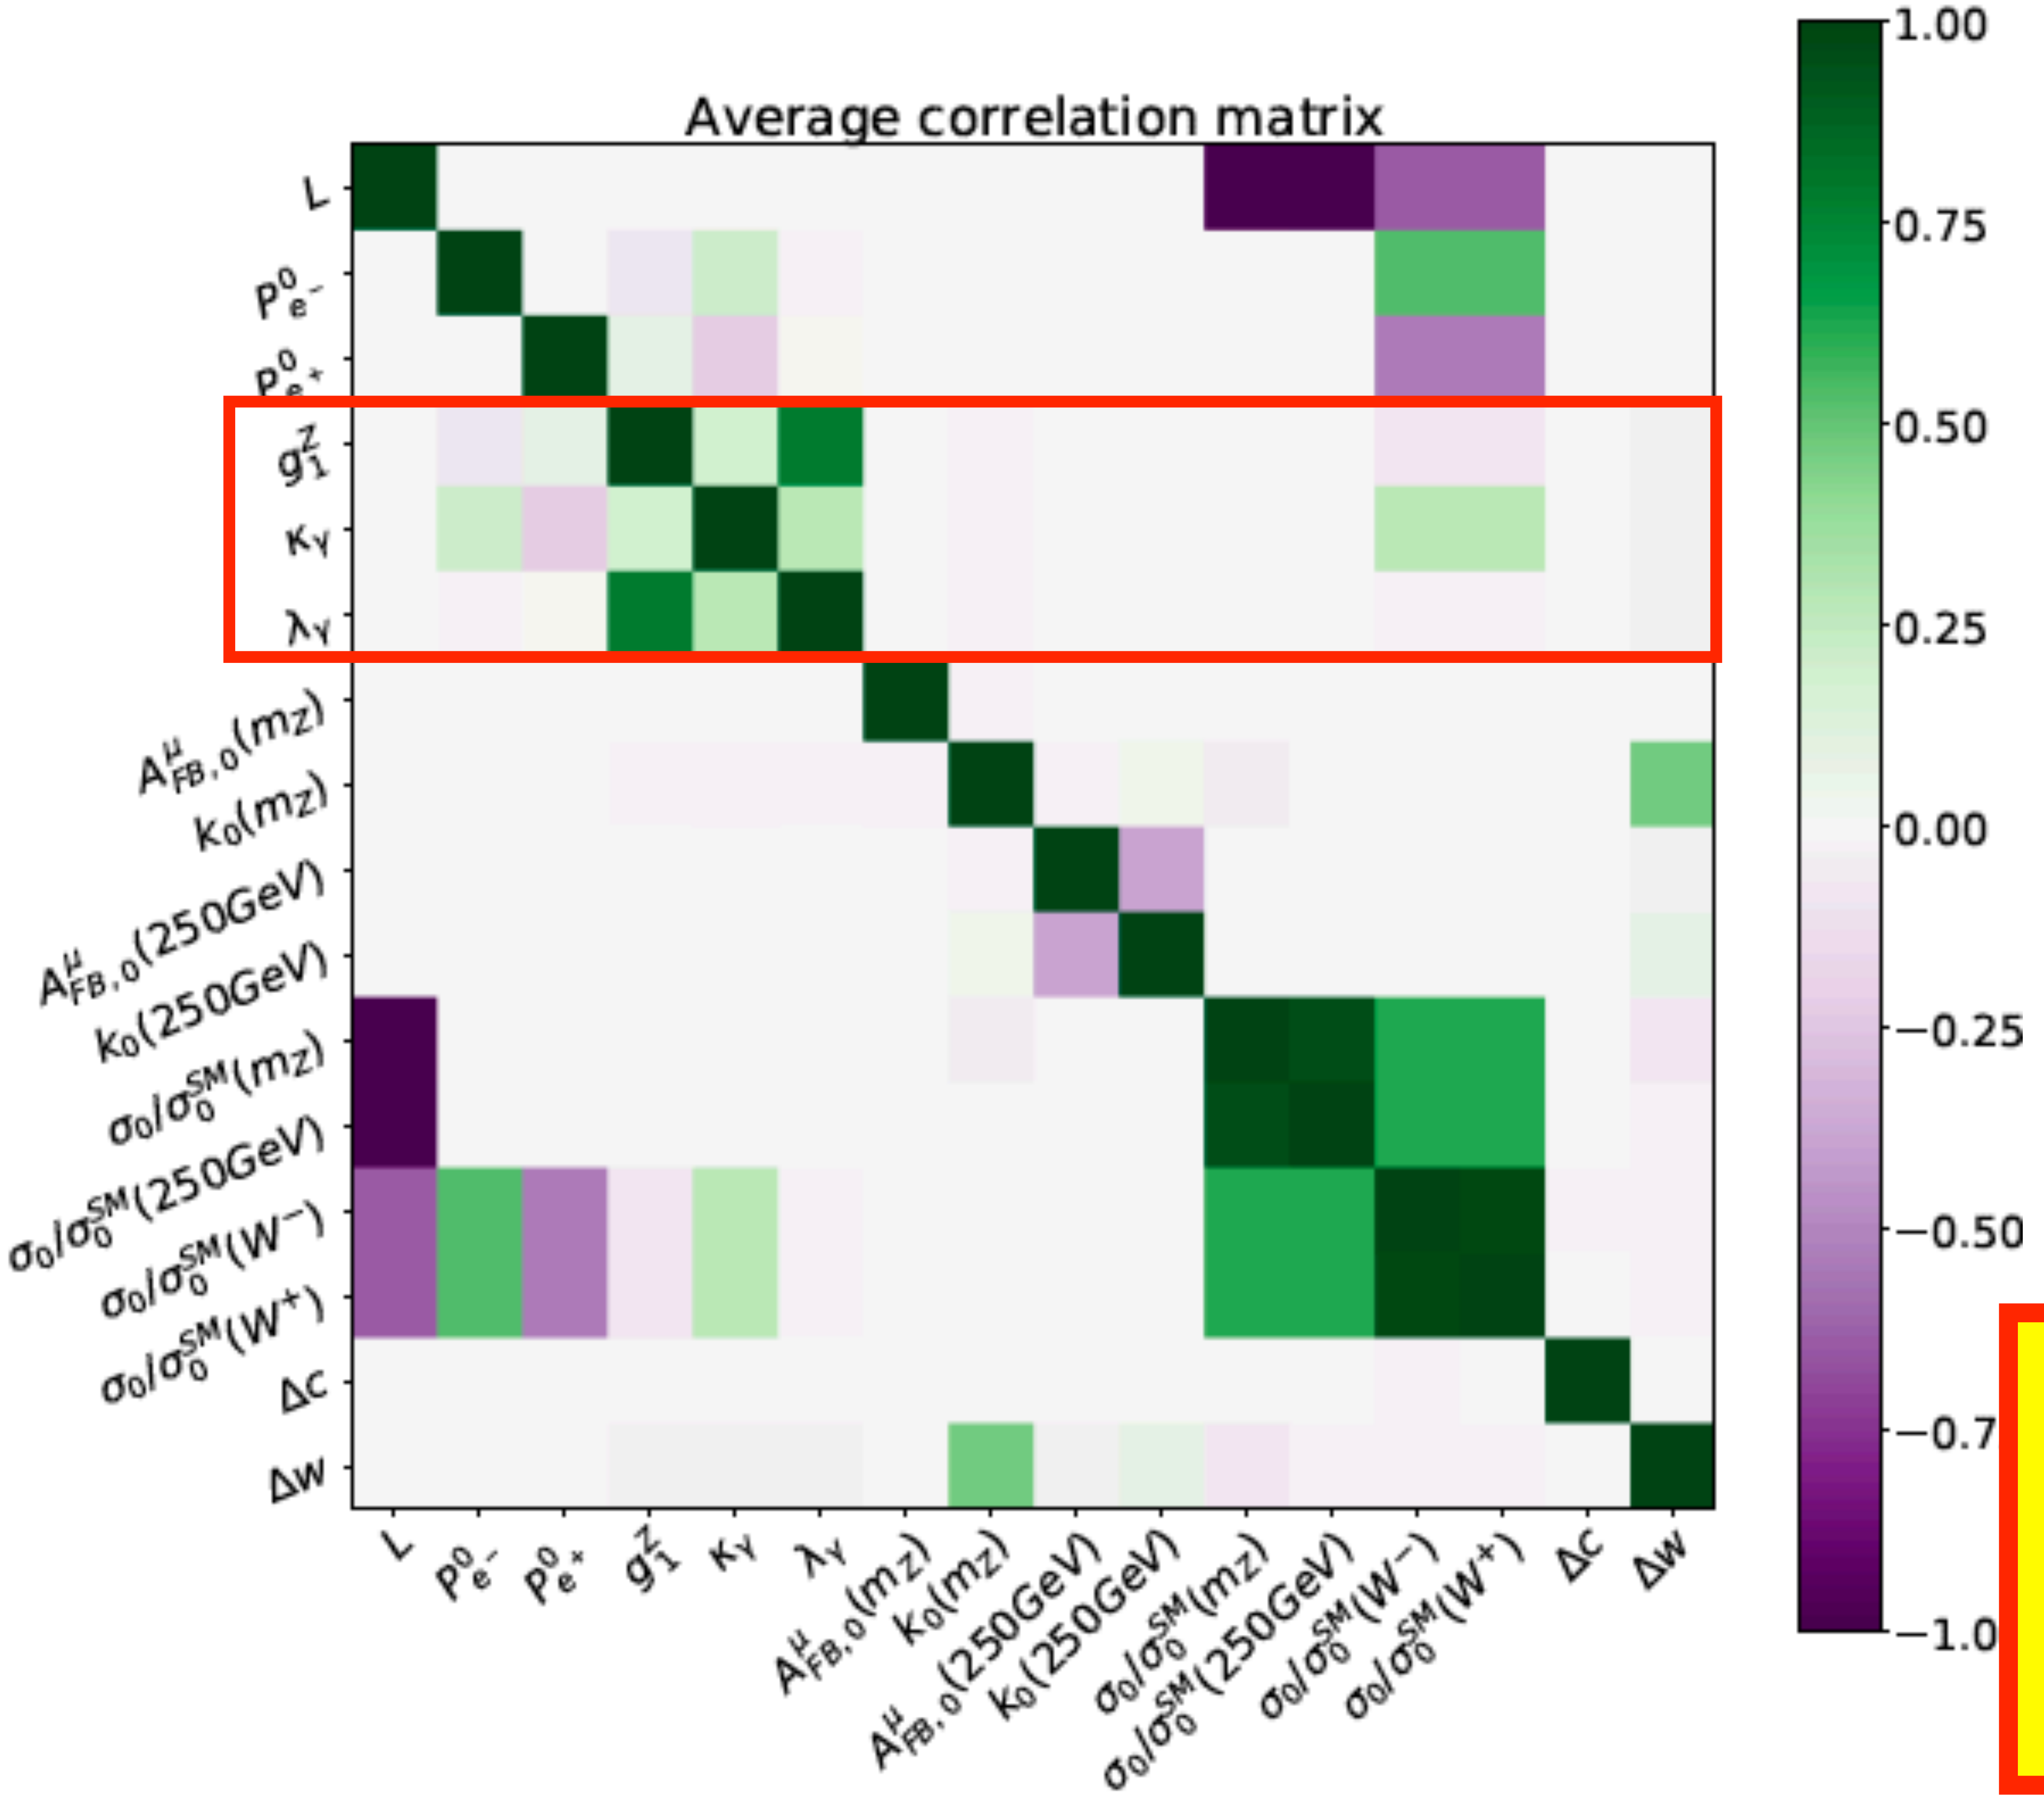
P = (0%,0%) vs **P = (±80%, ∓30%)**

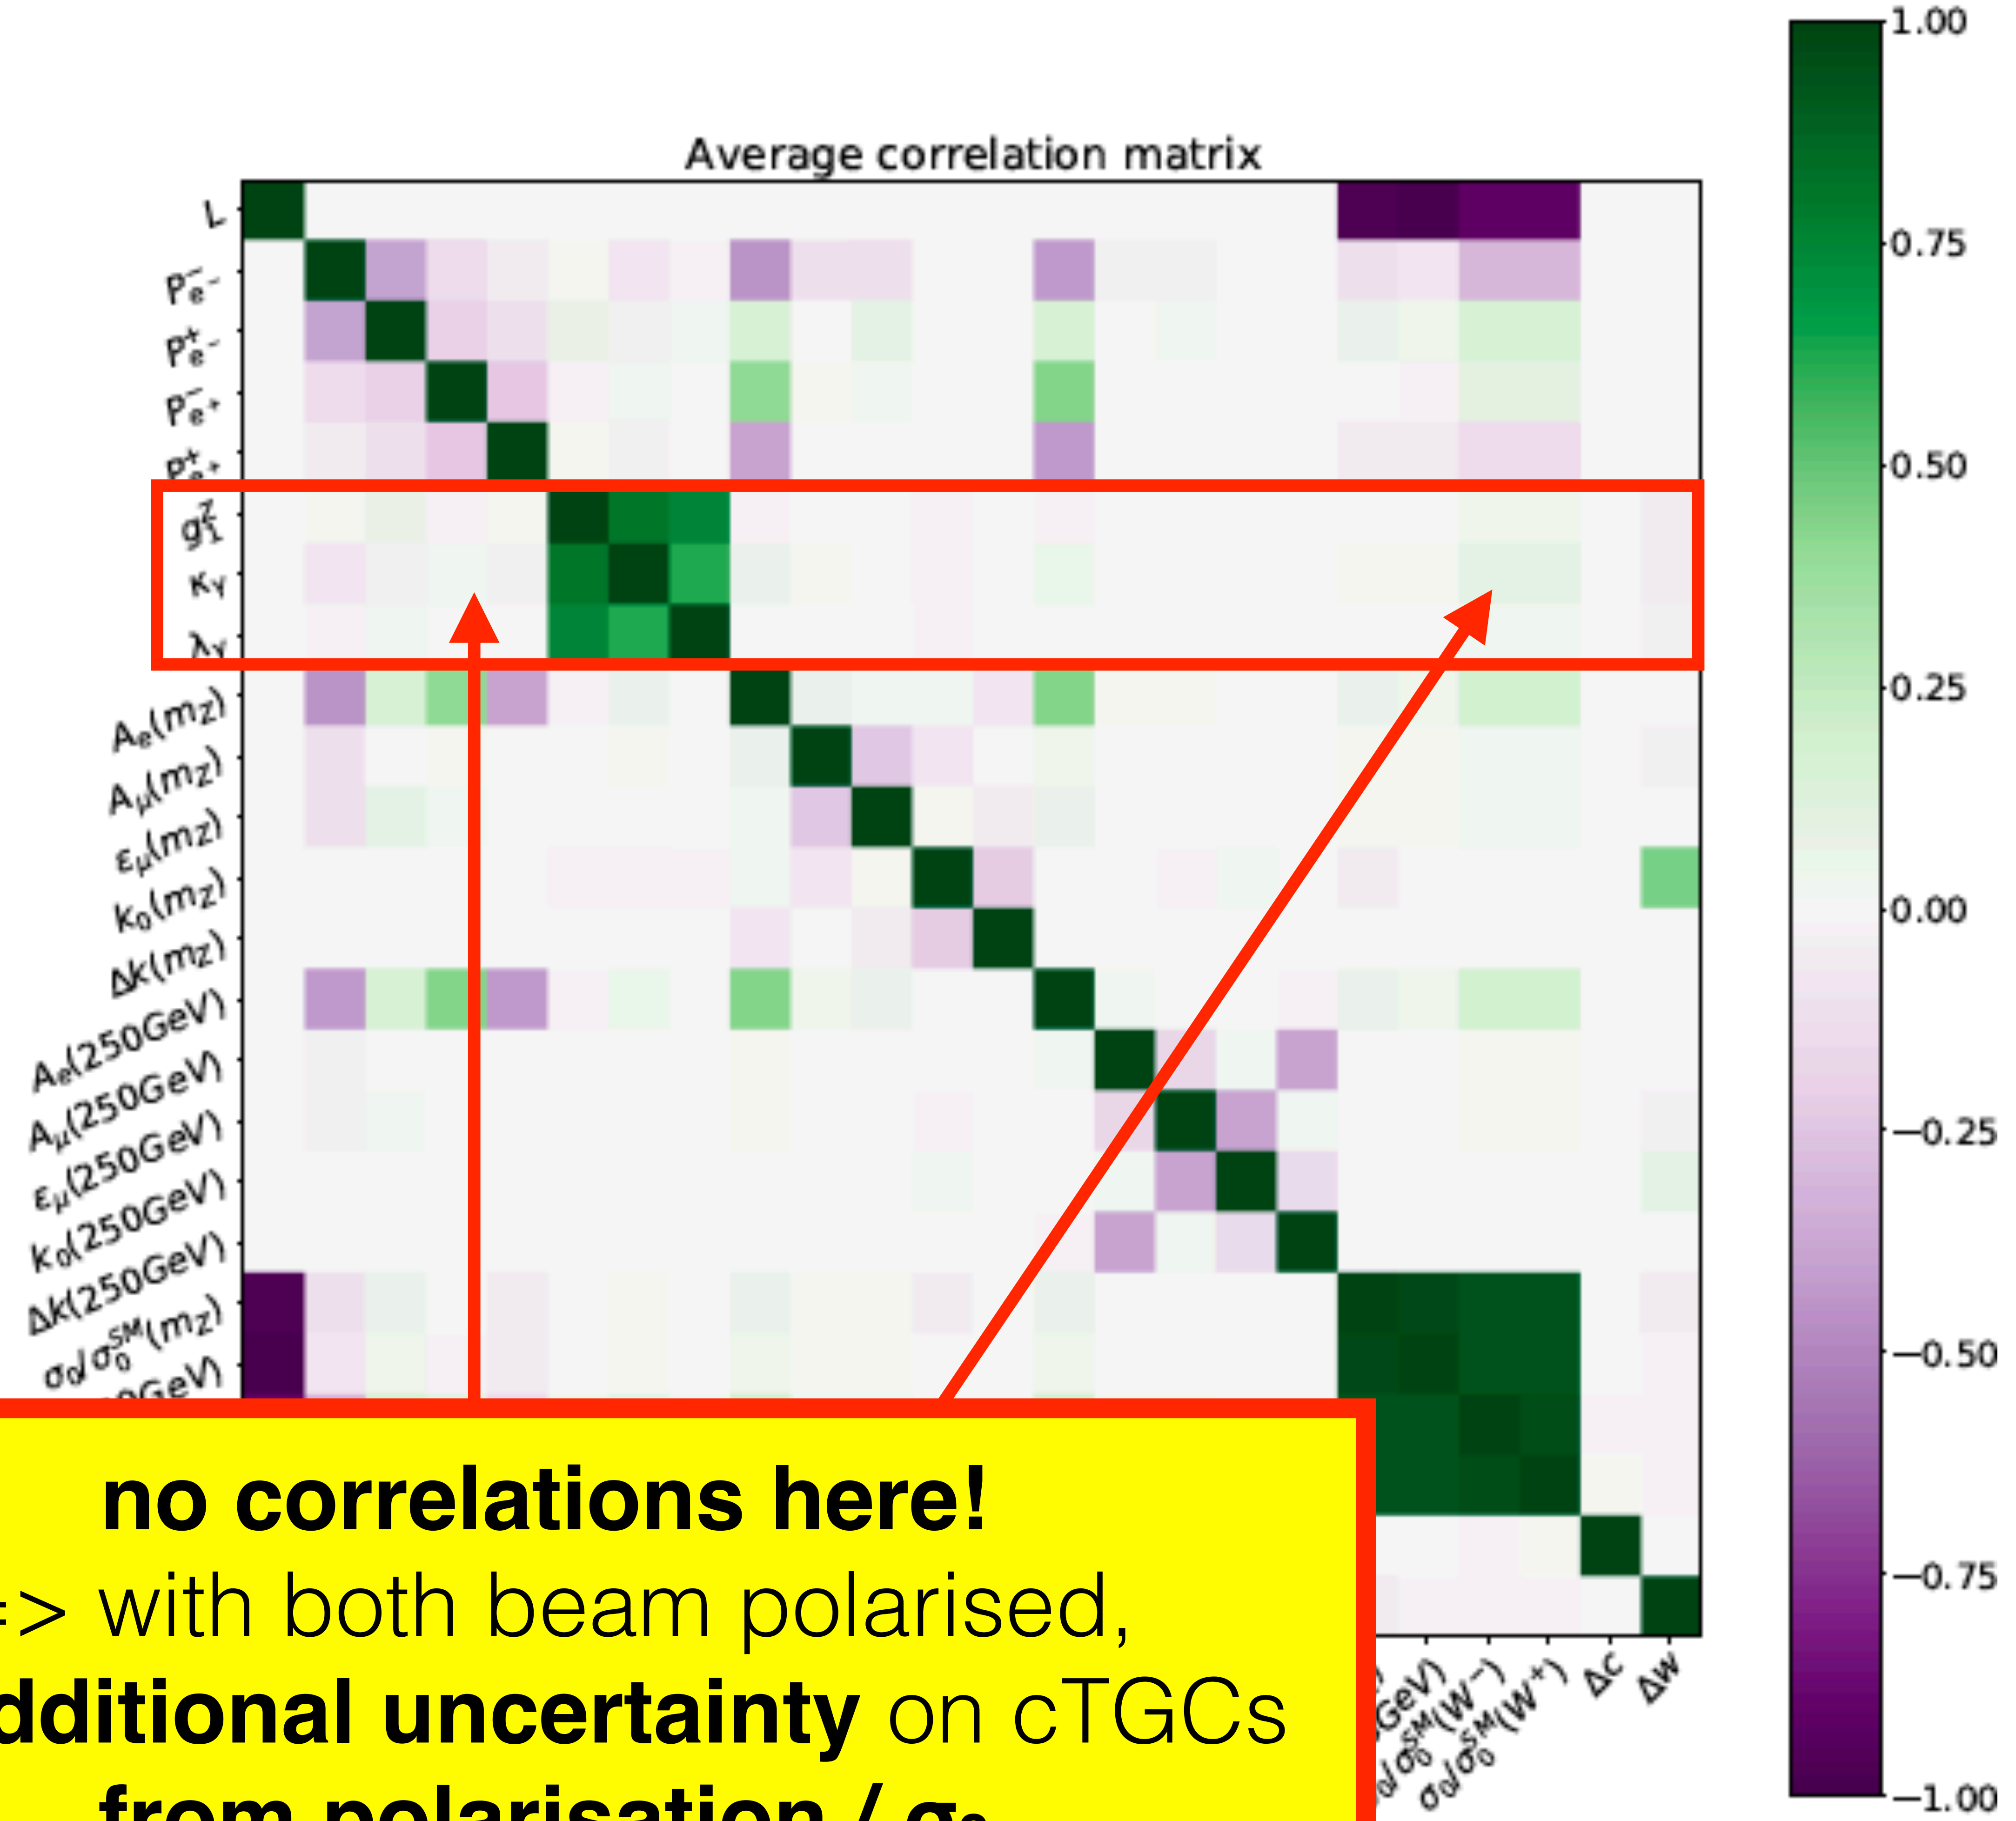




Can we determine polarisation AND devitions from SM?

P = (0%,0%) vs **P = (±80%, ∓30%)**

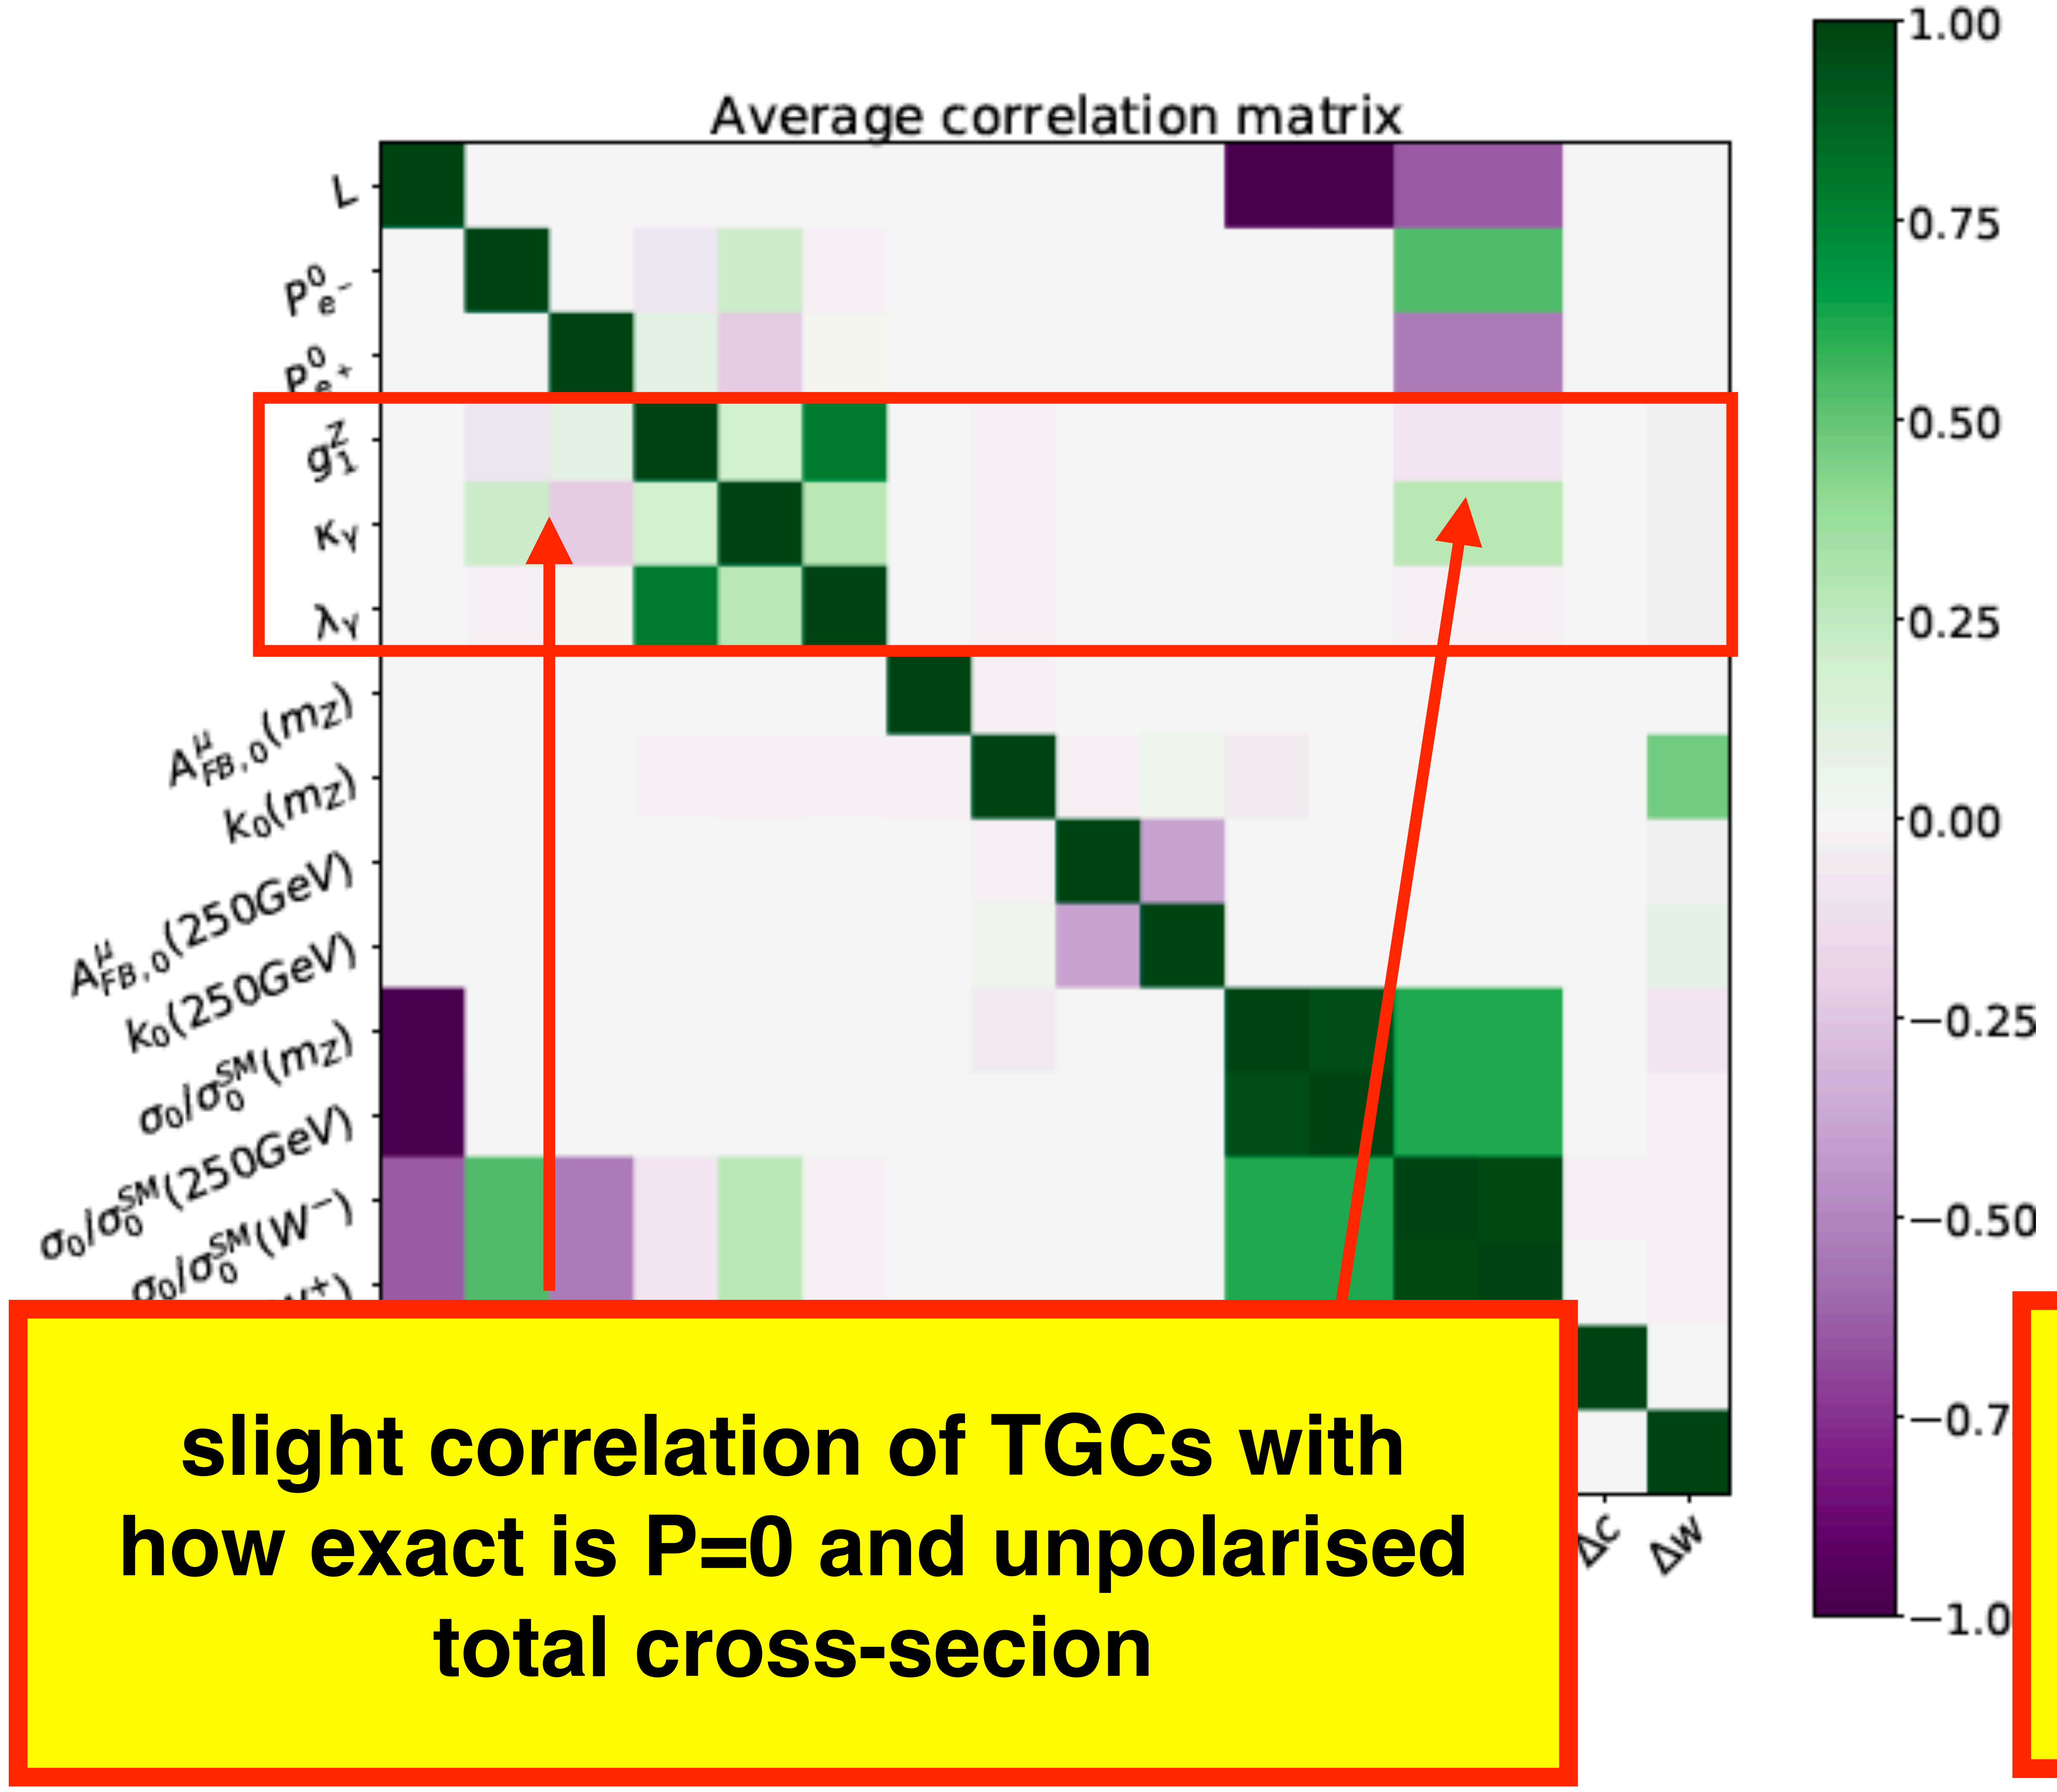


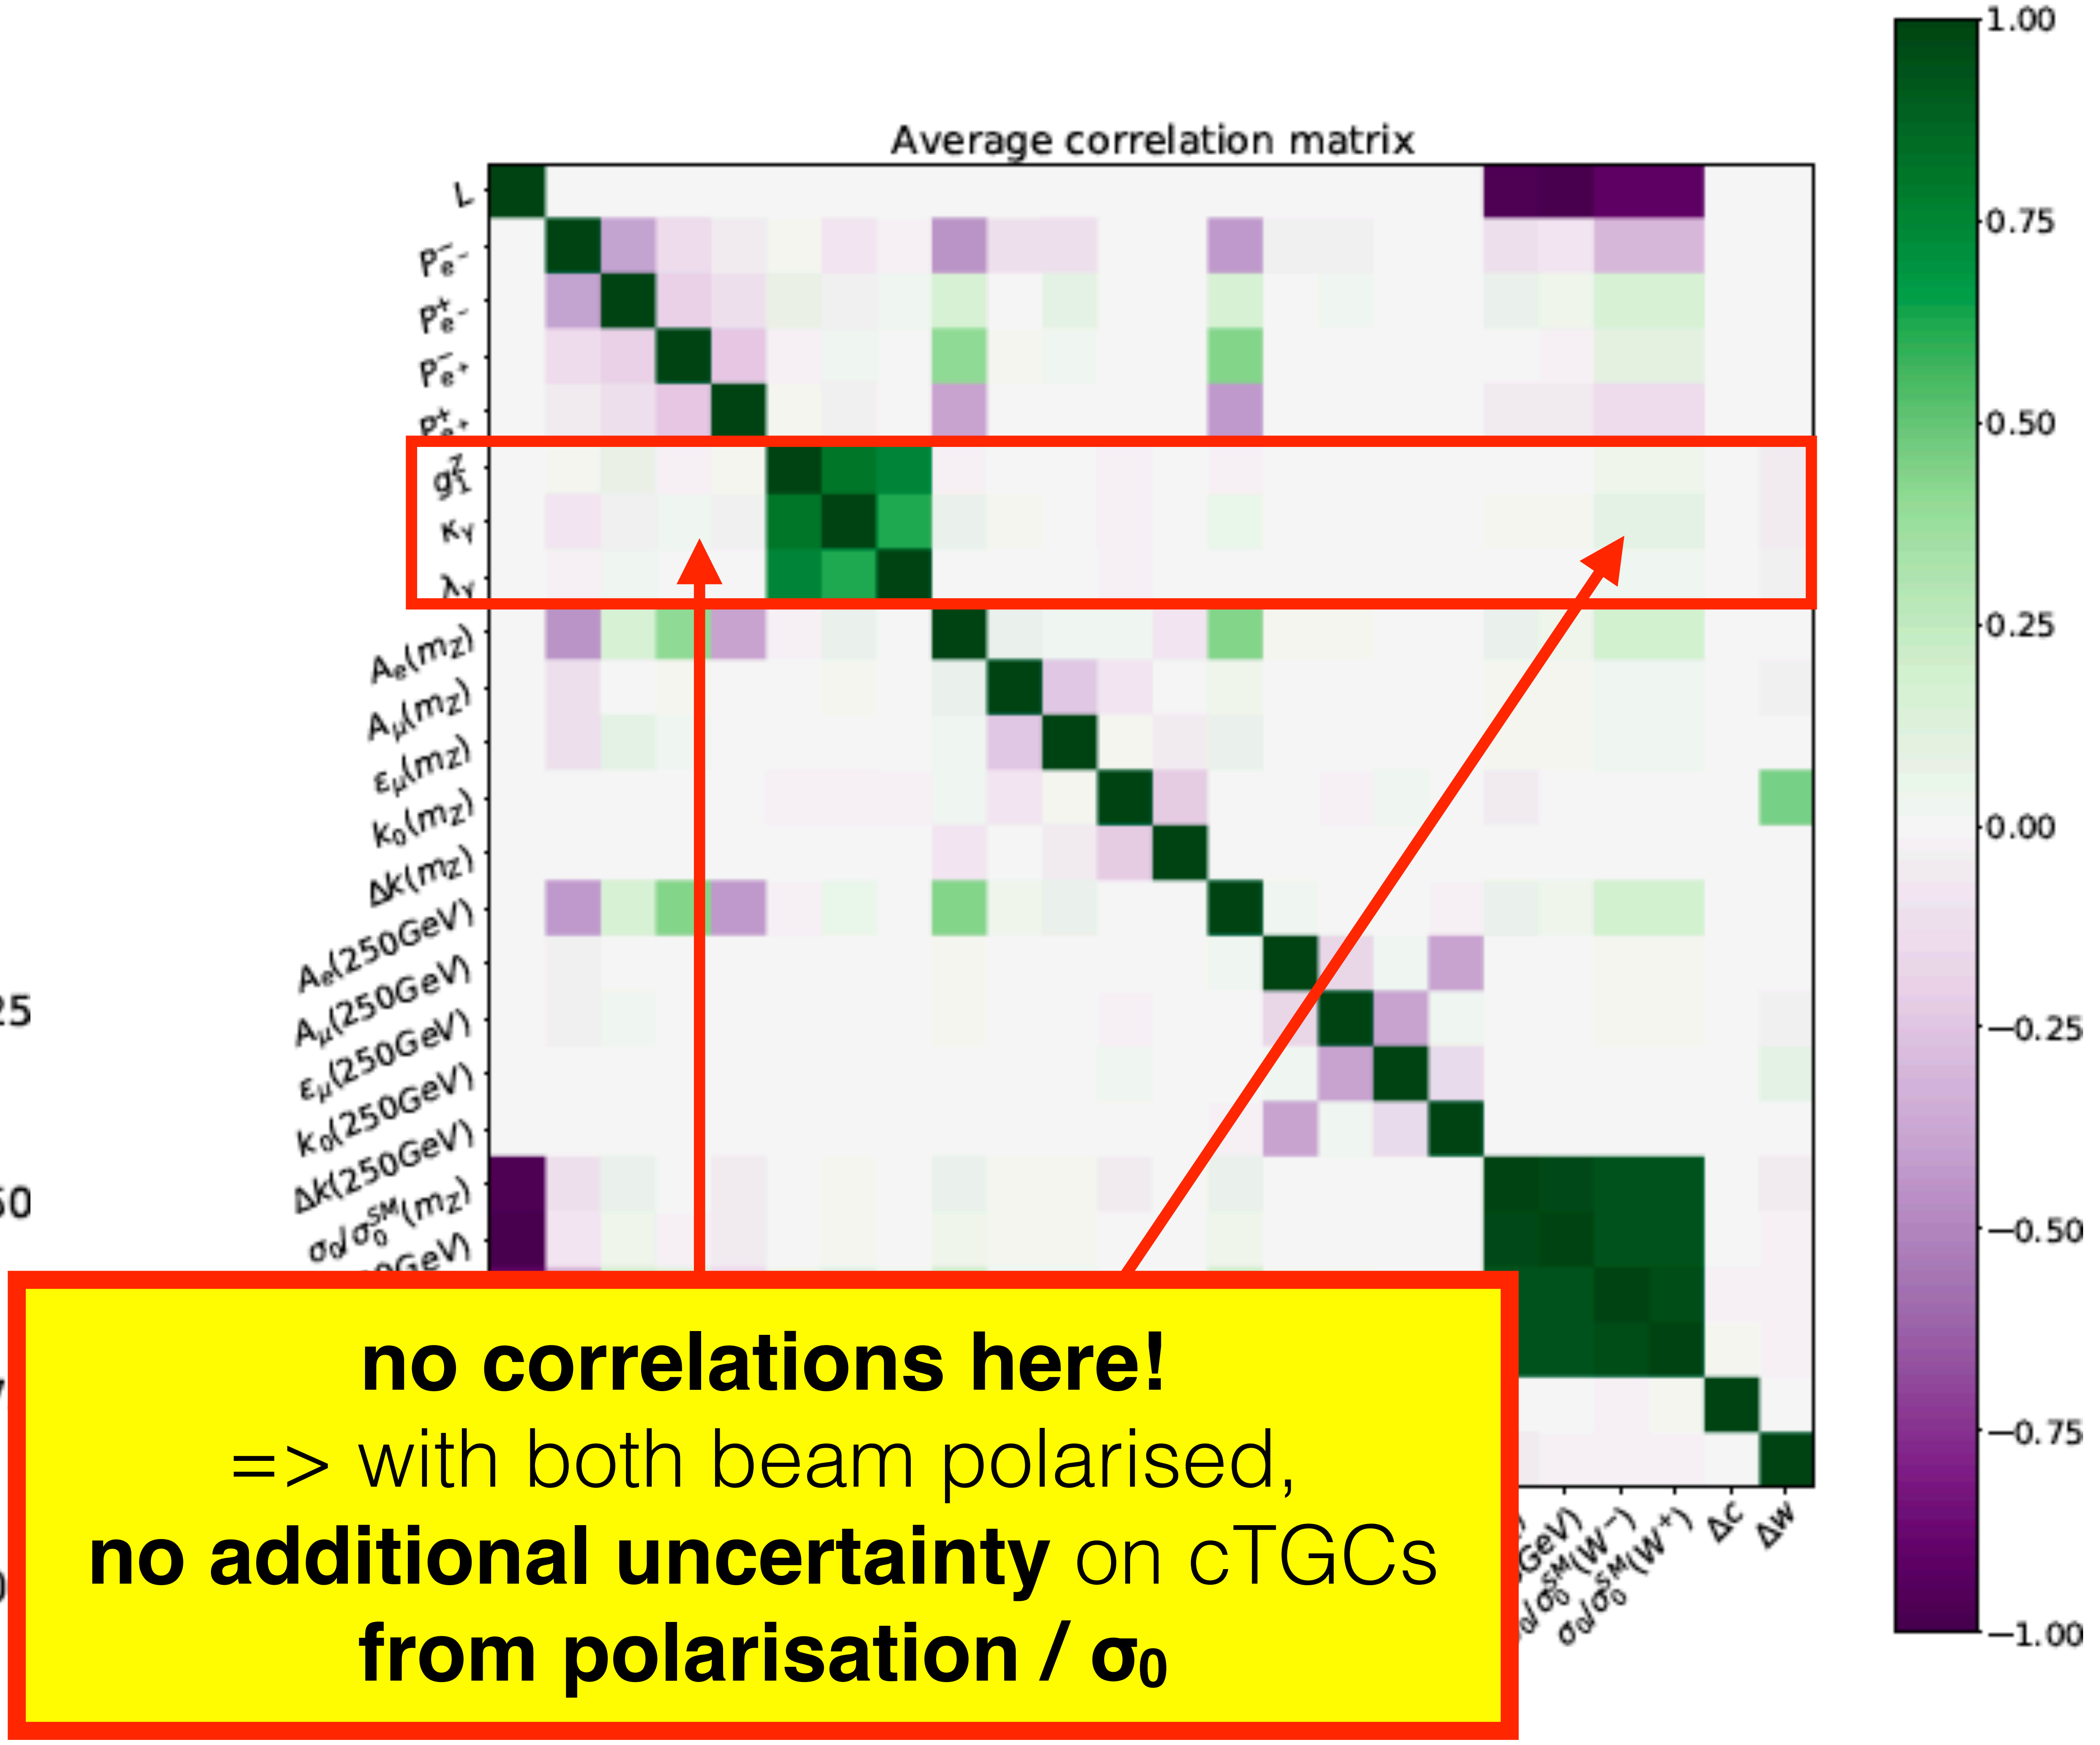


no correlations here!
=> with both beam polarised,
no additional uncertainty on cTGCs
from polarisation / σ_0

Can we determine polarisation AND devitions from SM?

P = (0%,0%) **vs** **P = (±80%, ∓30%)**





Impact of A_{LR}(WW)

- same effect seen in HL-LHC projections
- effect even stronger for HE-LHC

=> will require A_q's from lepton collider!

arXiv:1902.04070

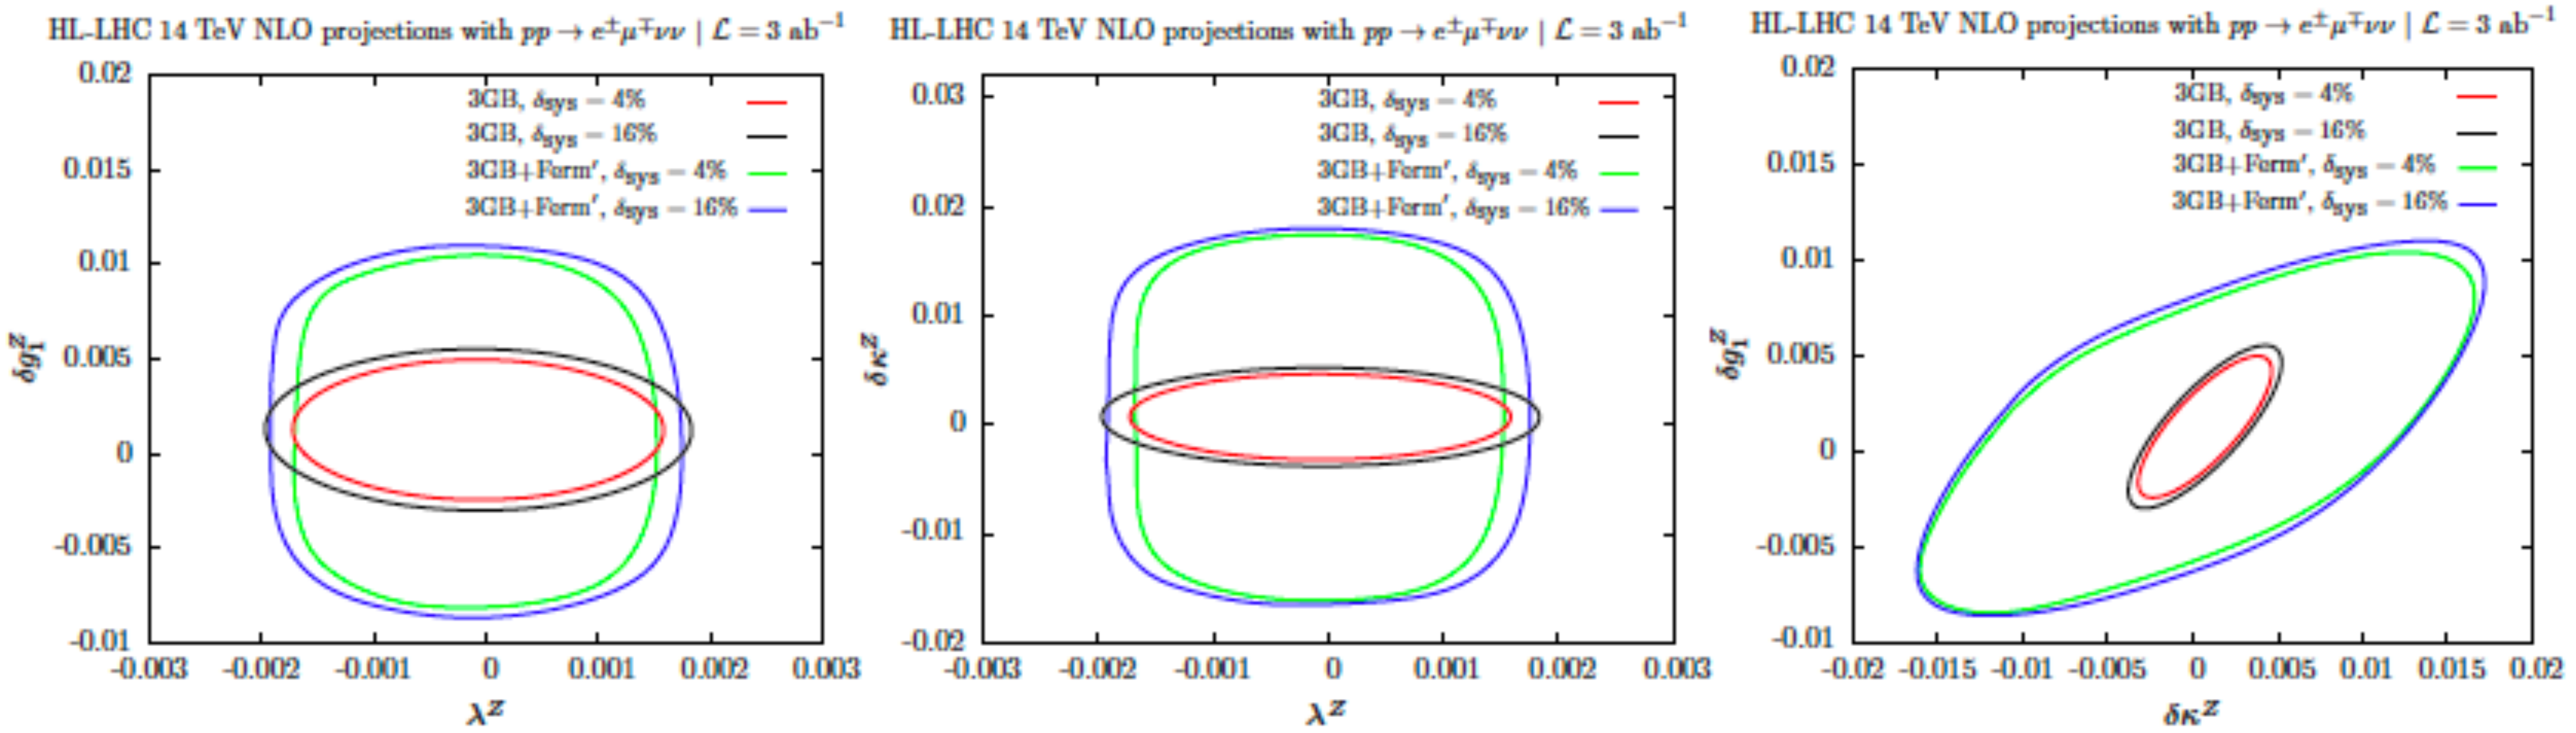


Fig. 40: Projections for 14 TeV with 3 ab^{-1}. $p_{T,cut}$ = 750 GeV, corresponding to δ_{stat} = 16% with δ_{sys} = 4% and δ_{sys} = 16%. The curves labelled 3GB have SM Z-fermion couplings, while the curves labelled 3GB +Ferm' allow the Z-fermion couplings to vary around a central value of 0.

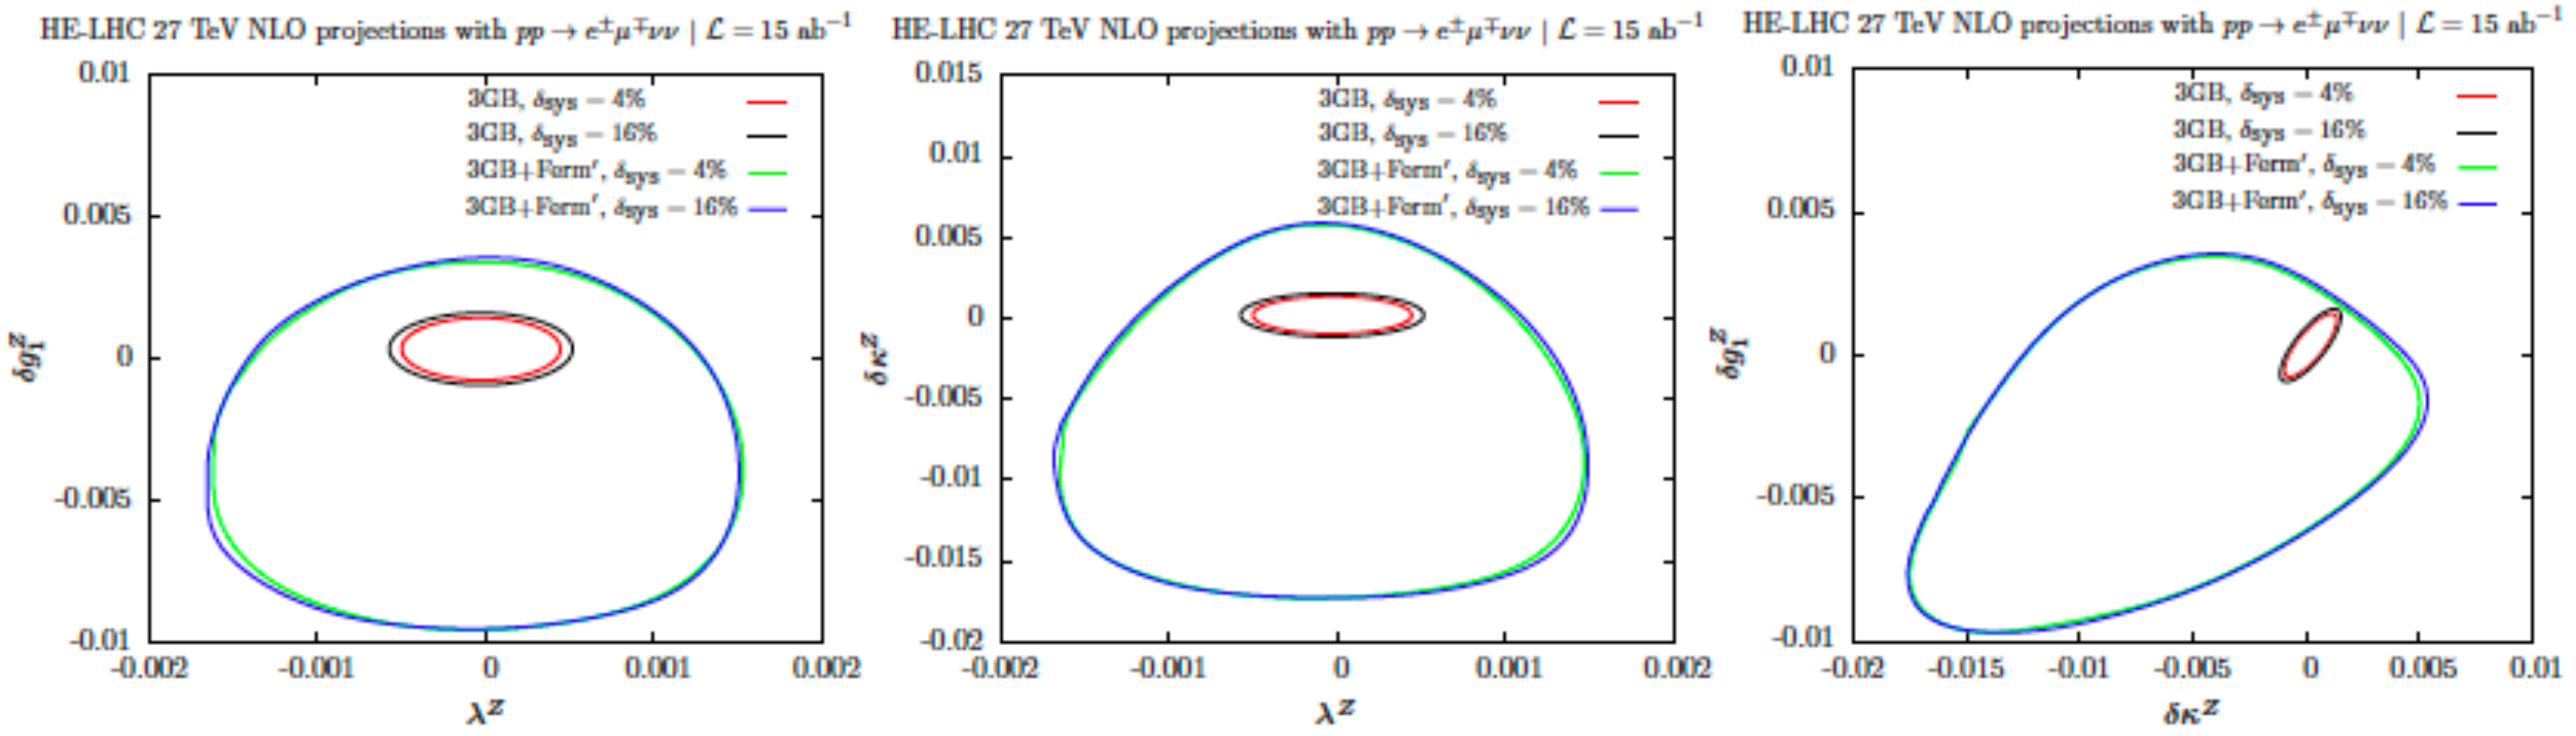

Fig. 41: Projections for 27 TeV with 15 ab^{-1}. $p_{T,cut}$ = 1350 GeV, corresponding to δ_{stat} = 16% with δ_{sys} = 4% and δ_{sys} = 16%. The curves labelled 3GB have SM Z-fermion couplings, while the curves labelled 3GB +Ferm' allow the Z-fermion couplings to vary around a central value of 0.
